**Abstract:** This document gives formal specifications and descriptions of the use cases that have been identified for the different pilots considered within CREDENTIAL. It describes all involved stakeholders, actors, and their interactions with the Cloud Identity Wallet.

This document is issued within the CREDENTIAL project. This project has received funding from the European Union's Horizon 2020 Programme under grant agreement no. 653454.

This document and its content are the property of the CREDENTIAL Consortium. All rights relevant to this document are determined by the applicable laws. Access to this document does not grant any right or license on the document or its contents. This document or its contents are not to be used or treated in any manner inconsistent with the rights or interests of the CREDENTIAL Consortium and are not to be disclosed externally without prior written consent from the CREDENTIAL Partners.

Each CREDENTIAL Partner may use this document in conformity with the CREDENTIAL Consortium Grant Agreement provisions.

The information in this document is provided as is, and no warranty is given or implied that the information is fit for any particular purpose. The user thereof uses the information at its sole risk and liability.

## Executive Summary

In traditional Identity and Access Management as a Service (IDMaaS) systems an Identity Provider (IdP) has full access to the user's identity data. The shift of such services into the cloud discloses sensible user data to the cloud provider. Thus, the user's privacy is compromised, and legal issues and challenges for service providers may arise. With the invention of proxy-re-encryption and redactable signature algorithms it is possible to outsource an Identity Provider into a cloud environment without disclosing the processed data to the cloud provider. While these novel cryptographic technologies are mature from a scientific research perspective they are not yet included in market-ready products. In this document actors and use cases will be elaborated, and explain how to integrate those technologies into an IDMaaS environment. We call this IDMaaS environment the CREDENTIAL Wallet.

The purpose of this document is to have a clear understanding of applicable business use cases and the identification of all actors involved in a CREDENTIAL Wallet. These generic artifacts form modularized basic blocks for a CREDENTIAL Wallet. Furthermore, this document shows how to apply these building blocks in three different application domains: eGovernment, eHealth, and eBusiness.

This document contains the collection of all generic business use cases for the CREDENTIAL Wallet. These use cases fully describe its functionality. Since business use cases tend to be abstract, we additionally specify logical use cases describing each step in the business use cases in more detail. Starting from these use cases, further development of the CREDENTIAL Wallet can proceed and requirements, architecture, and technology can be elaborated.

In order to show practical relevance of the proposed use cases, three pilots in the domains mentioned above adapted them and developed scenarios and storyboards. Thus we show how we can enhance existing applications and service by integrating a CREDENTIAL Wallet and its functionality. This document contains multiple scenarios for each domain and a list of business use cases describing on a high level how to use a CREDENTIAL Wallet in the domains.

# 1 Introduction

One of the fundamental techniques in requirements engineering is the use case analysis. It describes how actors interact with a system in order to achieve an overlying goal. Use cases are usually described in a text form but can also be visualized using formal notations like UML<sup>1</sup>. Various use case templates have been developed over time. The most common used templates are the ones defined by A. Cockburn<sup>2</sup> and the ones defined by M. Fowler<sup>3</sup>.

In this document use cases and actors are divided into three categories. They are organized from a top-down approach.

- The **business** category is the first one and describes use cases and actors at the highest abstraction level. In this category no connections to specific technologies are drawn. Instead it explains how actors can achieve a desired goal by using the CREDENTIAL system without describing the concrete steps.
- The **logical** category is the second one and refines the artifacts from the business category. Here the logical use cases are used to describe the individual steps the actors need to perform in the business use cases. If new actors are involved in order to fulfill the steps, they are assigned to the logical category of actors.
- The **technical** category is third. It draws the connection between concrete technologies and the logical use cases. They are out of scope for this document.

## 1.1 Goal of CREDENTIAL

The idea of the CREDENTIAL Wallet is to create a data-sharing and identity and access management platform in the cloud, which increases the security and privacy level compared to already existing solutions by using cryptographic primitives like proxy-re-encryption<sup>4</sup> or malleable signatures<sup>5</sup>. The Wallet itself acts as the safe data store where the participants' personal data is kept. The main features offered by the CREDENTIAL Wallet to participants are:

- Store and view personal data in the wallet
- Share personal data with other participants
- Using CREDENTIAL Wallet as IAM system for accessing other services
- Hide Information in documents to other participants while still guaranteeing the authenticity of the revealed data

<sup>3</sup> Writing Effective Use Cases – A. Fowler ISBN: 0201702258

<sup>4</sup> R. Johnson, D. Molnar, D. Song, and D. Wagner, “Homomorphic Signature Schemes,” in Topics in Cryptology - CT-RSA 2002, vol. 28913, 2002, pp. 244–262

<sup>5</sup> R. Johnson, D. Molnar, D. Song, and D. Wagner, “Homomorphic Signature Schemes,” in Topics in Cryptology - CT-RSA 2002, vol. 28913, 2002, pp. 244–262

The main benefit provided by these features is:

- Reduced trust assumption to the cloud provider are required
- Increased flexibility
- High security guarantees
- Strong authenticity guarantees

Most traditional cloud services providers have access to the plaintext data stored by their users, and thus users have to take care of encryption and the associated overhead (such as, e.g., key management) themselves. Recently, encrypted cloud storage providers entered the market, which relieve the users from these tasks. However, so far all fully cloudified IAM systems require access to plain data; in particular, currently every identity provider requires access to the users personal data in order to deliver its service. In CREDENTIAL, this shall be overcome by the use of cryptography.

Our solution offers an increased flexibility for a participant by offer a solution that is completely available in the cloud. Participants can store and share their data from anywhere and using different devices like smartphone, tablet or computer. The data is highly protected by novel cryptographic mechanisms in the cloud. At any processing stage the data is always encrypted in an end-to-end way. As soon the data leaves the participant’s device it is never available in plaintext in the cloud by design.

We offer strong authenticity guarantees for service provider. The identity information of participants can and will be used for Identity Management in the cloud by the CREDENTIAL Wallet provider. The CREDENTIAL mechanisms guarantees strong hardware-based multi-factor authentication mechanisms and the provided identity information in corresponding assertions are safely transmitted to the service provider.

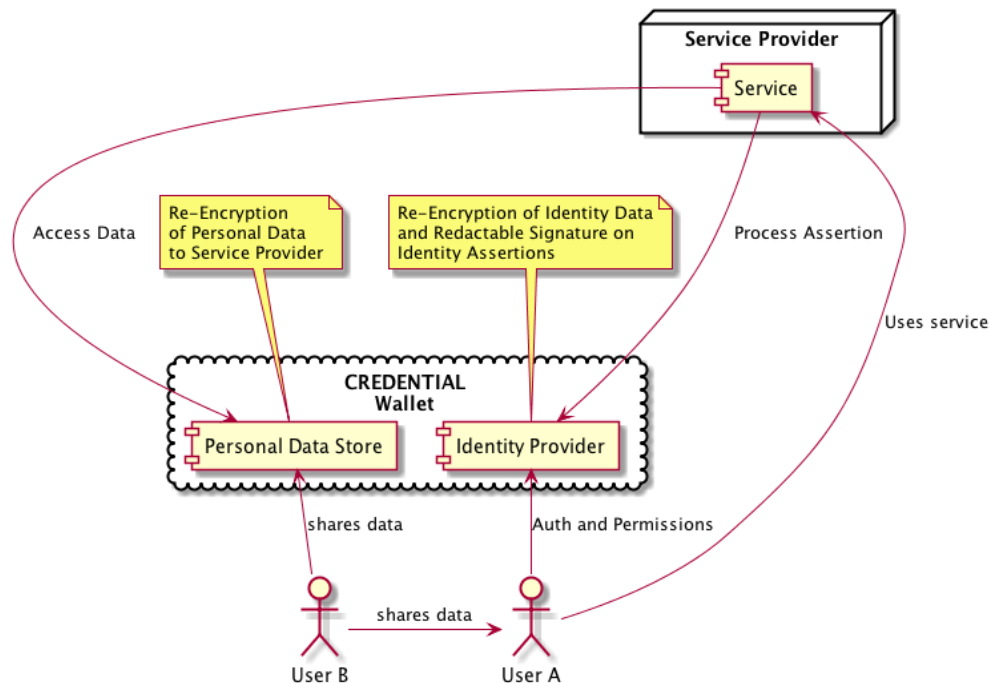

Figure 1: High Level Overview of CREDENTIAL Wallet

Figure 1 describes the main features of the CREDENTIAL Wallet. Firstly, it serves as a personal data store. Each participant can store any personal information safely in the cloud. A user can decide to share such information with other users by providing a forward rule in the CREDENTIAL Wallet. Now the other user is able to read the data without any more user interaction from the owner of the data because the wallet can process the forward rule. Since the data is encrypted, the wallet has to re-encrypt the data for the other user. In this whole process, the data is never disclosed for the wallet provider by design. Users cannot only share their data among each other, but also with service providers. The same mechanisms are used for this process. Access to the data is secured by the IAM system of the CREDENTIAL Wallet. The authentication process requires strong authentication mechanisms which will be enforced by the CREDENTIAL Wallet's Identity Provider. This Identity Provider issues identity assertions which are necessary to access any service or resource within the CREDENTIAL Wallet or using the wallet as the IAM in the cloud. It is protected by the novel cryptographic mechanisms like proxy-re-encryption or redactable signature. Thus we are able to provide user information stored in the wallet inside these assertions without the CREDENTIAL Wallet learning anything about the users' personal data revealed to the service provider.

## 1.2 Scope and Relation to Other Documents

The purpose of this document is twofold.

On the one hand, it documents the state of the art of secure cloud provider solutions and the requirements of various stakeholders. It analyzes, for the specific application domains of CREDENTIAL, the currently used technologies, and how they could be improved – in particular with respect to (data) privacy, authenticity, or usability – using CREDENTIAL technologies.

On the other hand, this document identifies concrete scenarios where CREDENTIAL could improve over the state of the art. From those scenarios, the main actors and their roles (with which they interact with the CREDENTIAL Wallet) are to be defined. These high-level use cases should then be decomposed into lower-level technical use cases in order to identify common functionalities across the domains, and provide inputs for the CREDENTIAL Wallet architecture. For this purpose, all identified use cases will be fully formalized.

Deliverable “**D2.1 Scenarios and use-cases**” does not depend on any other deliverable but on the work performed by most of the partners involved in the project. However, and given the pilot-centric approach of the project, the following deliverables will directly depend, at least partially, on this deliverable and/or in the work performed for its development:

- “**D2.3 Cloud identity wallet requirements**”: the requirement elicitation process will be driven by the functionalities required according to the use cases identified in this deliverable.
- “**D2.5 System security requirements, risk and threat analysis –2<sup>nd</sup> iteration**”: the analysis depends on the reference use cases identified in this deliverable.
- “**D2.6 User centric privacy and usability requirements**”: the requirement elicitation process will be driven by the functionalities required according to the use cases identified in this deliverable.
- “**D6.1 Pilot use case specification**”: a more detailed analysis of the use cases identified in this deliverable, taking into account CREDENTIAL's building blocks will be conducted.

Many other deliverables indirectly depend or are influenced by this deliverable but do not rely in this deliverable as an input. For instance, “**D3.2 UI Prototypes V2 and HCI Patterns**” will provide UI mockups for functionality that has been identified in the use cases identified in this deliverable.

This deliverable describes the results of multiple activities that have been conducted by CREDENTIAL’s partners:

Deliverable activity	Work Package Objective
Identify and define, in close collaboration with end-user partners, scenarios where the interaction with the Cloud Identity Wallet can add extra value to their services  Identify in this scenarios who are the different actors and stakeholders that are part of scenarios;	O.2.1 Identify strong scenarios and use cases for the Cloud Identity Wallet.
Develop formalized business use cases where business and end-user ‘s functionalities required are represented	O.2.3 Identify end-user and business user needs for the Cloud Identity Wallet.
Find the commonalities of the different business Use cases on the different domains and formalize them in generic business use cases  Move the generic use cases from a business level to a logical one enabling a deeper understanding of the Cloud Identity Wallet components and its functionalities	O.2.5 Define detailed use cases for the Cloud Identity Wallet acting as (i) Identity Provider, (ii) Attribute Provider, (iii) Personal Data Store, (iv) Credential Manager (e.g., passwords, certificates, assertions, etc.)

Table 1: Deliverable activities and WP objectives

Deliverable D2.1 is part of a bigger effort which is to design a Cloud Identity Wallet addressing end-users and businesses’ needs. Figure 2 shows the positioning of this deliverable in such global picture. This deliverable will identify pilot-specific business use cases which will be generalized and derived into generic logical use cases. The design efforts will be responsible of designing the collaboration among all the logical actors and components and how they will be technically implemented to fulfill the use cases. Pilots will be specified to demonstrate the relevant domain-specific use cases and in accordance to the specified functional design.

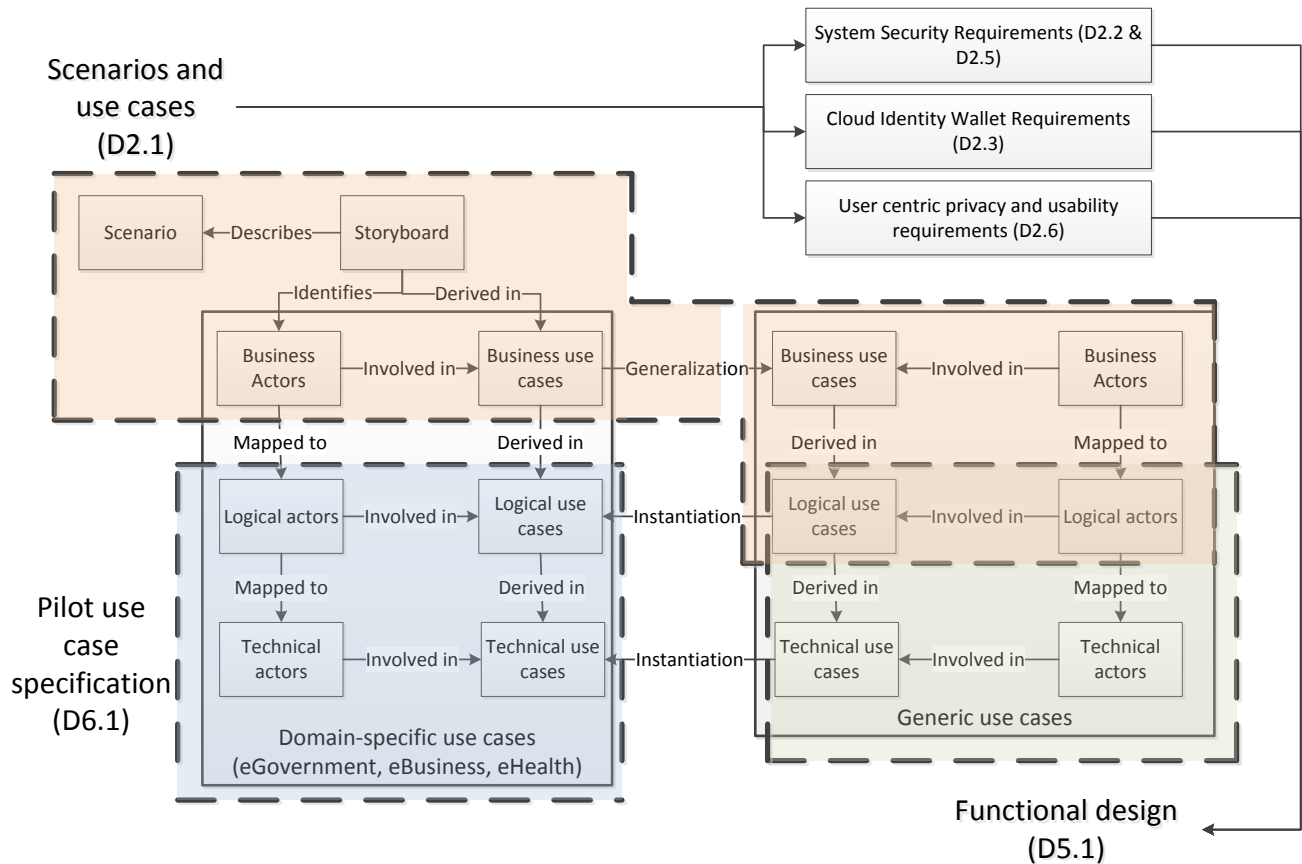

Figure 2: D2.1 as part of a broader mission

### 1.3 Document Outline

This document is structured as follows.

Section 2 describes the methodology which is used in order to derive the generic use cases and actors and how this work is included in the whole development process of the CREDENTIAL system.

In Section 3, the **generic use cases** for a CREDENTIAL system are described. It includes a detailed description of business actors and supporting logical actors from a generic point of view. The use cases for the business and logical category are described in this section.

In Section 4, the generic use cases are then applied in three different domains as **specific business use cases**. Each domain explains in form of a storyboard how the generic use cases can be used in their specific context. Furthermore, it explains the state of the art per domain and how a CREDENTIAL system can enhance products and solutions.

Finally, Section 5 gives a conclusion about the work done in this document and outlines the future work based on these results.

For readability, the main body of this document presents the use cases on a very high level only. The formal specifications of all use cases can be found in Appendix 1A.11A.1 (generic business use cases),

Appendix 1A.2 (generic logical use cases), and Appendix 1A.3 (domain specific business use cases), respectively.

## 2 Methodology

This section defines the terminology used in this document as well the description of the approach in order to create use cases for a CREDENTIAL system.

The documentation and creation of the use cases was made using a Redmine<sup>6</sup> wiki instance using the Requirements Engineering<sup>7</sup> plugin. The plugin has a built-in support for common requirement engineering frameworks. Mainly it supports the creation of use cases based on the templates introduced by A. Cockburn. In addition, it allows to create actors and requirements as own artifacts. Since it is a shared knowledge base we are able to keep track of relations between storyboards, use cases, and actors. The artifacts in this repository build the base for all upcoming development of the CREDENTIAL Wallet. Moreover, a graphical UML representation is provided for each storyboard and use case. UML diagrams are generated using the open source tool PlantUML<sup>8</sup>.

This report represents the current stable status of the generic business and logical use cases, as well as the domain specific business use cases. Due to the status of the project, minor modifications or extensions may become necessary during the implementation process and the pilot use case specification in D6.1.

Figure 3 shows an example use case and its relation to other artifacts.

**[BUC] Send Data**  
 Added by Florian Thiemer 2 months ago. Updated less than a minute ago.

		<b>Issues</b>	

**Description**  
 A user sends data from his IT-System to CREDENTIAL Wallet or to a Service Provider protected by CREDENTIAL technology. The user encrypts his data using CREDENTIAL technology. He authenticates himself against the wallet and submits the data to the wallet. The wallet performs an authorization on the performed action. After a successfully authorization the data is registered in the wallet. When the process is finished the wallet performs an auditing of every previous action performed in this step. A Human interaction is possible with Participant's IT System.

**Preconditions**

1. User has a CREDENTIAL account
2. User has write access rights

**Postconditions**

1. Data is registered in the wallet

**UML**

## 2.1 Terminology

To avoid confusion, we will next fix some terminology that we will use throughout this document.

### 2.1.1 Storyboards

Story boards are a central tool for describing the high-level functionality of the CREDENTIAL Wallet.

**Storyboard** – A storyboard describes at a high level, using the terms of a specific domain, from a user point of view what functionality a system offers to him. It contains all of the structured information to explain a story. It contains a purpose, actors, pre-conditions, scenario, post-conditions, and a UML diagram.

**Precondition** – The precondition contains one or multiple statements about what need to be fulfilled before a use case.

**Postcondition** – The postcondition describes in one or multiple statements what is the effect of the use case.

**Scenario** – This is the central piece in a storyboard. It describes at a very high level what actors can do with existing technologies and how CREDENTIAL technology can improve the user experience.

### 2.1.2 Use Cases

We use use cases for a more fine granular specifications of the functionality of the CREDENTIAL Wallet. We distinguish the following four types:

**Generic Use Case** – A generic use case describes one or more general functionalities of the CREDENTIAL Wallet. It abstracts from any domain and focusing on the CREDENTIAL Wallet itself.

**Pilot Use Case** – A Pilot use case describes one or more functionalities of the CREDENTIAL Wallet inside a specific domain. It can be a specialization of a generic use case but can also stands for its own and thus enhance the CREDENTIAL Wallet with optional features.

**Business Use Case** – A business use case is an activity in a storyboard where actors are involved. A business use case is derived from a storyboard.

**Logical Use Case** – A logical use case is a single step in a business use case. It describes how two actors interact with each other.

### 2.1.3 Actors

Actors are natural or technical entities that are participating in use cases and story boards. We distinguish the following types of actors:

**Business Actor** – This is an actor in a business use case. Business actors can be humans, systems, or legal actors.

**Logical Actor** – This is an actor in a logical use case. Logical actors can be humans, systems, or legal actors.

**Human Actor** – This is a natural persons involved in the scenario.

**System Actors** – This is a technical entity involved in the scenario.

**Legal Actors** – This is a legal party involved in the scenario.

**Persona** – This is an actor in a storyboard which has some characteristics in order to describe specific use cases for different types of people. Usually personas are used for developing the use cases in a way that most of the possible imaginary user types are covered in the use cases.

## 2.2 Approach

In order to derive generic use cases that describe the general functionality of the CREDENTIAL system we follow a bottom up approach. Each pilot is challenged with the task to identify current business issues in their domain which can be solved or better handled by using proxy-re-encryption<sup>9</sup> and redactable<sup>10</sup> signature algorithms in the context of their domain, IAM and cloud service providers. We include pilots from three different domains – namely eGovernment, eHealth and eBusiness. Each pilot describes multiple storyboards including existing applications and services.

The storyboards describe at a high level how a CREDENTIAL system can be integrated and used in the context of the domain. The heart of a storyboard is the scenario. It uses personas and a textual description of what these personas do in a scenario. Mainly it describes the interaction between humans and systems in a coherent story. These scenarios do not necessarily introduce specific CREDENTIAL components but are designed in a way that features of a CREDENTIAL Wallet can enhance the user experience or even develop new functionalities.

All actors involved in a scenario are extracted and assigned to a different type. The types are human actor, system actor, and legal actor.

From the storyboards we identify business use cases. For each activity initiated by an actor in a storyboard we create an own business use case. Each storyboard can contain multiple business use cases and some of them can occur in multiple storyboards. To keep track of such relationships we are using custom relationships in the Redmine wiki. The following table describes all relationships, where they occur and to which artifact type they can link.

Relationship	Occurs in	Links to	Description
<b>BUC_in</b>	Business use cases	Storyboards, business use case	Indicates that a business use case is referenced in another business use case or Storyboard.
<b>LUC_in</b>	Logical use cases	Business use case, logical use case	Indicates that a logical use case is referenced in another logical use case or business use case.
<b>Actor_in</b>	Human Actor,	Storyboards,	Indicates that an Actor is referenced

<sup>9</sup> M. Blaze, G. Bleumer, and M. Strauss, “Divertible protocols and atomic proxy cryptography,” in In EUROCRYPT. Springer-Verlag, 1998, pp. 127–144.

<sup>10</sup> R. Johnson, D. Molnar, D. Song, and D. Wagner, “Homomorphic Signature Schemes,” in Topics in Cryptology - CT-RSA 2002, vol. 28913, 2002, pp. 244–262

Relationship	Occurs in	Links to	Description
	system actor, legal actor	business use case, logical use case	in another Storyboard, business use case or logical use case.
<b>Generic Actor</b>	Human Actor, system actor, legal actor	Human Actor, system actor, legal actor	Indicates that an actor is a generic actor and derived from the referenced actor.
<b>Generic UC</b>	Business use case, logical use case	Business use case, logical use case	Indicates that a use case is a generic use case and derived from the referenced use case.

Table 2: Custom relationships defined in Redmine

After describing the business use cases they will be further subdivided into multiple logical use cases. Each logical use case represents an individual step in the corresponding business use case between two actors. Additional actors may be introduced in this process. These newly created actors will be tagged as Logical Actors.

We describe business use cases and logical use cases according to the following structure:

Use Case Name	Name of the Use Case
<b>ID</b>	Unique ID of the use case. The ID follows the pattern: [DOMAIN]-[TYPE]-[UNIQUENAME], where: <ul style="list-style-type: none"> <li>• DOMAIN is either “G” for generic use cases, or “E-GOV”, “E-HEA”, or “E-BUS” for domain-specific use cases from the eGovernment, eHealth, or eBusiness pilots, respectively;</li> <li>• TYPE indicates whether it is a business use case (“BUC”) or a logical use case (“LUC”);</li> <li>• UNIQUENAME is unique and describes what is included in the use case.</li> </ul>
<b>Main Actor</b>	According to A. Cockburn <sup>11</sup> , the main actor of a use case is defined as follows: “[The] primary actor of a use case is the stakeholder that calls on the system to deliver one of its services. It has a goal with respect to the system – one that can be satisfied by its operation. The primary actor is often, but not always, the actor who triggers the use case.”
<b>Secondary Actors</b>	Again following A. Cockburn, secondary actors are defined as “actors that the system needs assistance from to achieve the primary actor’s goal.” A use case can have one or multiple secondary actors.
<b>Pre-conditions</b>	One or multiple pre-conditions, i.e., conditions that need to be satisfied before the use case can be executed.
<b>Post-conditions</b>	One or multiple post-conditions, i.e., guarantees that are satisfied after a successful execution of the use case.
<b>Description</b>	A detailed description for this use case.
<b>Image</b>	A UML representation of the use case. We use UML sequence diagrams to describe the use cases.

Table 3: BUC and LUC description structure

<sup>11</sup> Cockburn, A, 2000, Writing Effective Use Case, Addison-Wesley Professional; Edition 1

## 3 Generic Use Cases

In this section, we present the identified generic actors, generic business use cases, and generic logical use cases.

A *generic use case* describes one or more general functionalities of the CREDENTIAL Wallet. It abstracts from any domain and focuses on the CREDENTIAL Wallet itself. A *generic actor* is a component, person, or system that is included in such a generic use case.

Generic use cases are derived through a bottom up approach from the pilot-specific use cases. The process has been carried out defining firstly the pilot storyboards and scenarios and then deepening into business and logical use cases and Actors definition before entering the generalization process to generic business and logical use cases and generic actors. For a matter of clarity this deliverable first presents the derived generic use cases and then the pilot specific use cases.

A total of 33 business use cases were identified and more refined in a total of 108 logical use cases.

### 3.1 Actors

#### 3.1.1 Business Actors

The business actors are the entities which are defined on the Business Level. They are firstly introduced by identify the business use case and tend to be as abstract as possible.

##### 3.1.1.1 Human Actors

**CREDENTIAL Participant** – A person who uses the CREDENTIAL Wallet. He can store data in the CREDENTIAL Wallet and uses its features in order to share his personal data. A user has a CREDENTIAL account and possesses credentials on his smartphone or computer which allows him to authenticate against the CREDENTIAL Wallet or other Identity Providers that support CREDENTIAL technology.

**CREDENTIAL Admin** – A user who has administrative privileges in the CREDENTIAL Wallet. An administrator is able to create new accounts, ban users, and similar tasks. He possesses credentials on his computer in order to authenticate against the CREDENTIAL Wallet.

##### 3.1.1.2 System Actors

**CREDENTIAL Wallet** – The CREDENTIAL Wallet is the central platform where data storage, data exchange and authentication occurs. The CREDENTIAL Wallet can be either a portal offering services to users and other service provider or be a collection of libraries which supports the integration of CREDENTIAL technology in existing systems.

**Service Provider** – A Service Provider is an external Service which can be used by CREDENTIAL Participants.

**Identity Provider** – An entity or system responsible to authenticate users online. It guarantees that users are uniquely identified and properly authenticated. It usually issues an Identity Assertion which contains a proof of the user's identity a signature which states that the Identity Provider authenticates the user and

additional attributes that can be used by other Service Provider to identify and authorize the user. Attributes may be encrypted.

**CREDENTIAL Participant's IT-System** – The IT-System used by a CREDENTIAL Participant in order to use the CREDENTIAL Wallet. This could be a smartphone, a webserver, a computer, etc. Additional CREDENTIAL software may be installed on this IT-System which allows the integration in the CREDENTIAL Wallet workflow.

**eID** – eID is an acronym for electronic identification. This could be a smartcard, available for citizens and organizations, provided by government authorities, banks, or other companies. Usually they contain an X.509 digital certificate with the purpose of authenticate the user during online transactions.

**CREDENTIAL Participant's Cold Storage** – Place where participant's recovery keys are safely stored. For example, USB Stick, QR Code, etc.

**Signing Service** – An external signing service which allows to sign a document if a valid PIN is provided.

### 3.1.1.3 Legal Actors

No generic legal actors were defined.

## 3.1.2 Logical Actors

### 3.1.2.1 Human Actors

No generic human actors were defined.

### 3.1.2.2 System Actors

**CREDENTIAL Re-Encryption Key Generation Service** – This component is an integral part of the innovative and secure data sharing mechanism presented by CREDENTIAL. It generates re-encryption keys that will be used by the CREDENTIAL Wallet or independent re-encryption components to transform encrypted data so it can be decrypted by the data receiver. By generating this re-encryption key from her private key and distributing it to an authorized proxy, the participant owning encrypted data enables sharing and thereby provides some form of consent. After this key was generated, the user does not have to be actively involved in the sharing process anymore.

**CREDENTIAL Personal Trust Store** – The component Personal Trust Store is responsible to provide a secure place for storing the high confidential CREDENTIAL participants private key next to the public key. Only authorized participants are permitted to gain access to this private key.

**CREDENTIAL Encryption Service** – In order to ensure the confidentiality of the user's possibly sensitive data in untrusted environments, these attributes are protected by cryptography. CREDENTIAL uses proxy re-encryption instead of traditional public key encryption to support flexible sharing of the participants' ciphertexts. This component performs the encryption process, which requires public key material of the receiver. User's may encrypt data for themselves and upload the resulting ciphertext. However, a third party, for example another user, may also provide data that was encrypted for the user. Eventually, the recipient controls the sharing of encrypted data by issuing re-encryption keys.

**CREDENTIAL Sign Service** – The CREDENTIAL Sign Service as part of the CREDENTIAL Participant's IT-System or the CREDENTIAL Wallet.

**CREDENTIAL Decryption Service** – In order to ensure the confidentiality of the user's data the CREDENTIAL Wallet encrypts all data. All encrypted data have to be decrypted as well at a specific point. That is why this component is one of the fundamental parts of the CREDENTIAL Wallet. This component performs a service which decrypts a given ciphertext utilizing the related private key. A possible scenario is that the user wants to see his data and therefore the decrypt service has to be performed.

**CREDENTIAL Proxy Re-Encryption Service** – The CREDENTIAL Wallet offers novel cryptographic mechanism to ensure the confidentiality of the user's data. One cryptographic primitive is the proxy re-encryption which is utilized when sharing data while preserving the confidentiality. Conceptually, the re-encryption mechanism performs both a decryption of a ciphertext as well as the encryption in one step using the re-encryption key. The advantage of this re-encryption mechanism is that the proxy is not able to see the plain text but only to re-encrypt the ciphertext. For example, a ciphertext which is encrypted for participant A is re-encrypted for participant B.

**CREDENTIAL Participant Registration Service** – This component is responsible for registering a new, or deleting an existing account of a CREDENTIAL Wallet. Upon de-registration, also all data related to the specific user should be deleted from the wallet.

**CREDENTIAL Participant Data Repository** – This is the service where the actual data blobs of a user get stored. Data can be written through an interface to the repository and can be retrieved for returning data to a user or for re-encryption.

**CREDENTIAL Participant Data Search Service** – The CREDENTIAL Data Search Service as part of the CREDENTIAL Wallet. Data Search Service and Data Repository are closely coupled maybe even integrated as search operation will always use some meta-information of the stored data to discover it. If meta information might be stored in an independent registry the coupling might become more loose but additional operations to register the meta-information will have to be integrated.

**CREDENTIAL Participant Index** - This index contains identifiable information about users. It is written by the CREDENTIAL Participant Registration Service, and is queried by the CREDENTIAL Participant Search Service.

**CREDENTIAL Participant Search Service** – This service allows one to search for the public key of a participant, which is needed for re-encryption. The key might, e.g., be found given the user's email-address as input.

**CREDENTIAL Authorization Service** – The authorization service is responsible for giving or denying permission requests to services, data or resources in general. There is a close relationship between the Identity Provider and the authorization service, as the authorization policies may be directly linked to specific users (i.e. “user a” wishes to give “user b” full access to all his data).

**CREDENTIAL Audit Trail Service** – In general an audit trail is a full historic list of all actions that are relevant for a certain service or resource. This service/component will be responsible to keep reference

and allow querying all the relevant actions within CREDENTIAL i.e. whenever participants different from the owner access and/or modifies some data.

**CREDENTIAL Data Repository Provider** – Manages access to documents that are not stored in CREDENTIAL. The Data Repository Provider has to implement the same logical functionality as the Participant Directory and the Data Search Service.

**CREDENTIAL Identity Provider** – In the context of CREDENTIAL, an Identity Provider (IdP) is a component which is responsible for creating, maintaining and managing identity information of data subjects (citizens or organizations). It provides data subjects authentication to other stakeholders (i.e. online services). How the IdP interacts with the data subject in order to create, manages or maintain its data is out of CREDENTIAL's scope. The main purpose of the IdPs in CREDENTIAL's ecosystem is to provide identity information to other actors.

**CREDENTIAL Attribute Service** – The Attribute Service is used to manage access to information (identity attributes) stored about a CREDENTIAL user.

**CREDENTIAL Redactor Service** – This service is able to redact fields in a document but maintains the validity of the signature using malleable signature techniques. For example, all data on an electronic driver's license is blacked out, except for the name and date of birth. With this minimized but still signed document, a person would be able to prove her age.

**CREDENTIAL Key Generation Service** – This component generates public/private key-pairs, compatible with the re-encryption schemes chosen for CREDENTIAL. The public key will act the public Wallet account identifier, while the generated private key must be safely stored in the participant's IT systems and will be required to perform many actions within the wallet.

**CREDENTIAL Authentication Service** – The CREDENTIAL Authentication Service authenticates participants against the CREDENTIAL Wallet. It consumes credentials provided by the participant's, verifies them and in a successful case issues an Identity Assertion with which a participant is able to use CREDENTIAL services.

**IdP Selector** – A service which allows users to select from a list of available Identity Providers.

### 3.1.2.3 Legal Actors

No legal actors were defined.

## 3.2 Generic Use Case Description

In the following we give an overview of the generic business use cases and the related generic logical use cases. For the sake of readability, we only give a high-level description here. All technical details can be found in the appendix.

### 3.2.1 Generic Business Use Cases

The generic business use cases (generic BUCs) are grouped into the following categories:

- Data Management
- Authentication

- Authorization
- Account Management
- Cryptography

In the following, we give a brief introduction to each of those categories. Detailed specifications of all mentioned use cases can be found in Appendix 1A.1.

### 3.2.1.1 Data Management

This category covers all aspects of sharing data in the CREENTIAL Wallet. Besides the obvious use cases like sending/storing, downloading/reading, or securely deleting data, it also covers the possibility of forwarding data to other users, or to export data from the CREENTIAL Wallet for various purposes. Also, users can see all previous access to their data or get notified upon changes of their data. Finally, a user’s personal data can be used to access a service provider.

In more detail, the following use cases are specified in this cluster:

Use Case Name	Unique ID	Main Actor
<b>Export CREENTIAL Wallet data into form</b>	G-BUC-EXPFORM	CREENTIAL Wallet
<b>Send Data</b>	G-BUC-SENDDATA	CREENTIAL Participant’s IT-System
<b>Read Data</b>	G-BUC-READDATA	CREENTIAL Wallet
<b>Forward Data</b>	G-BUC-FORWARDATA	CREENTIAL Wallet
<b>Send Notification</b>	G-BUC-SENDNOTIFICATION	CREENTIAL Wallet
<b>Delete Data Set</b>	G-BUC-DELETEDATASET	CREENTIAL Wallet
<b>Export Data from Wallet</b>	G-BUC-EXPORTDATA	CREENTIAL Wallet
<b>View all accesses to my Data</b>	G-BUC-VIEWACCESSES	CREENTIAL Participant’s IT-System
<b>Recover CREENTIAL Wallet data</b>	G-BUC-RECOVERDATA	CREENTIAL Wallet

Table 4: Generic Data Management BUCs

### 3.2.1.2 Authentication

This category is concerned with various aspects of authentication.

It contains the following use cases:

Use Case Name	Unique ID	Main Actor
<b>Authentication using SmartCard</b>	G-LUC-AUTHSMARTCARD	eID
<b>Logout from CREENTIAL Wallet</b>	G-BUC-LOGOUTWALLET	CREENTIAL Wallet
<b>Authenticate towards CREENTIAL Wallet</b>	G-BUC-AUTHWALLET	CREENTIAL Participant’s IT-System
<b>SP build up Trust relation to IdP</b>	G-BUC-SPBUILDTRUSTIDP	Service Provider
<b>Access Service Provider</b>	G-LUC-ACCESSSP	CREENTIAL Participant

Table 5: Generic Authentication BUCs

### 3.2.1.3 Authorization

Authorization is concerned with requesting and granting access rights to specific files to different users. Also, it covers the re-generation of access rights if a user has to change his cryptographic key material, e.g., because of a compromised device.

Use Case Name	Unique ID	Main Actor
<b>Request Access Rights</b>	G-BUC-REQACCESSRIGHTS	CREDENTIAL Wallet
<b>Grant Access Rights</b>	G-BUC-GRANTACCESSRIGHTS	CREDENTIAL Wallet
<b>Re-Generate Access Rights</b>	G-BUC-REGENACCESSRIGHTS	CREDENTIAL Participant's IT-System

Table 6: Generic Authorization BUCs

### 3.2.1.4 Account Management

Account management is concerned with all issues concerning registration or de-registration (through the user or through the CREDENTIAL admin). It allows users to list previous logins to their account, and allows them to link their CREDENTIAL Wallet with compatible service providers in order to authenticate to those services using CREDENTIAL in the following. Also, users can register new devices in order to access their wallet from this device in the following.

In more detail, the use cases associated to this category are:

Use Case Name	Unique ID	Main Actor
<b>Link Service Provider account with CREDENTIAL account</b>	G-BUC-LINKSPWITHCRED	CREDENTIAL Participant's IT-System
<b>Register new CREDENTIAL Account</b>	G-BUC-REGCREDACCOUNT	CREDENTIAL Participant's IT-System
<b>De-Register From CREDENTIAL</b>	G-BUC-DEREGISTERCREDENTIAL	CREDENTIAL Wallet
<b>View Previous Logins to My Account</b>	G-BUC-VIEWLOGINS	CREDENTIAL Wallet
<b>Ban a User</b>	G-BUC-BANUSER	CREDENTIAL Wallet
<b>Register new device for accessing CREDENTIAL Wallet</b>	G-BUC-REGNEWDEVICE	CREDENTIAL Participant's IT-System
<b>Unlink device from CREDENTIAL Wallet</b>	G-BUC-UNLNKDEVICE	CREDENTIAL Participant's IT-System

Table 7: Generic Account Management BUCs

### 3.2.1.5 Cryptography

This category contains all interactions inherently using cryptographic technologies such as proxy re-encryption or redactable signatures.

In particular, this category contains the following use cases:

Use Case Name	Unique ID	Main Actor
<b>Generate new access-key for CREDENTIAL Wallet</b>	G-BUC-GENACCESSKEY	CREDENTIAL Participant's IT-System
<b>Generate new Recovery Key</b>	G-BUC-GENRECKEY	CREDENTIAL Participant's IT-System
<b>Proxy Re-Encryption</b>	G-BUC-PROXYREENCRYPTION	CREDENTIAL Wallet
<b>Remote Signature</b>	G-BUC-REMOTESIGNATURE	CREDENTIAL Participant's IT-System
<b>Selective Disclosure</b>	G-BUC-SELECTIVEDISCLOSURE	CREDENTIAL Participant's IT-System

Table 8: Generic Cryptography BUCs

## 3.2.2 Generic Logical Use Cases

After the definition of the generic business use cases we are focusing now on the more detailed generic logical use cases (generic LUCs). While the business use cases describe the CREDENTIAL Wallet at a very high level the logical use cases break down each step in a business use case and describe in more detail the functional flow between components in the CREDENTIAL Wallet. Business use cases only use high level actors like the CREDENTIAL Wallet itself or a Service Provider. By breaking down the

functionality in logical use cases more fine granular actors are introduced with specific roles in- and outside of the CREDENTIAL Wallet.

The generic logical use cases are grouped into the following four categories:

- Data Management
- Authentication
- Authorization
- Account Management

Note that in contrast to the business use cases, we do not have a dedicated category “Cryptography” here. This is because the logical use cases are more detailed than the BUCs, and the different categories are more intertwined. Having a dedicated category for cryptographic steps here would split related LUCs into different categories. For instance, sending encrypted data would be part of “Data Management” (sending the data), and “Cryptography” (encrypting the data before), which would make it hard to navigate through the document.

Details on all generic logical use cases are given in Appendix 1A.2.

### 3.2.2.1 Data Management

The generic BUCs related to data management are made precise through the following 34 generic LUCs.

Use Case Name	Unique ID	Main Actor
<b>Re-Encrypt Data</b>	G-LUC-REENCDATA	CREDENTIAL Wallet
<b>Verify Recovery Request</b>	G-LUC-VERIFYRECOVERYREQUEST	CREDENTIAL Wallet
<b>Read Recovery Private Key</b>	G-LUC-READRECOVERYPRIVKEY	CREDENTIAL Participant’s IT-System
<b>Fill Registration Form</b>	G-LUC-FILLREGFORM	Service Provider
<b>Render Registration Form</b>	G-LUC-RENDERREGFORM	Service Provider
<b>Add additional attributes in Registration Form</b>	G-LUC-ADDATTRIBUTSREGFORM	CREDENTIAL Participant
<b>Submit Registration Form</b>	G-LUC-SUBMITREGFORM	CREDENTIAL Participant’s IT-System
<b>Auditing</b>	G-LUC-AUDITING	CREDENTIAL Wallet
<b>Receive Data</b>	G-LUC-RECDATA	CREDENTIAL Wallet
<b>Decrypt Data</b>	G-LUC-DECDATA	Service Provider
<b>Encrypt Data using CREDENTIAL</b>	G-LUC-ENCDATA CREDENTIAL	CREDENTIAL Participant’s IT-System
<b>Send Encrypted Data</b>	G-LUC-SENDENCDATA	CREDENTIAL Participant’s IT-System
<b>Register Data</b>	G-LUC-REGDATA	CREDENTIAL Wallet
<b>Define Request Parameters</b>	G-LUC-DEFREQPARAMS	CREDENTIAL Participant’s IT-System
<b>Request Data</b>	G-LUC-REQDATA	CREDENTIAL Participant’s IT-System
<b>Search Data</b>	G-LUC-SEARCHDATA	CREDENTIAL Wallet
<b>Request Signature</b>	G-LUC-REQSIGN	CREDENTIAL Participant’s IT-System
<b>Create Signature Request</b>	G-LUC-CREATESIGNREQ	External Signature Service
<b>Provide Signature Request</b>	G-LUC-PROVSIGNREQ	CREDENTIAL Participant’s IT-System
<b>Provide Data in Signature Request</b>	G-LUC-PROVDATASIGNREQ	CREDENTIAL Wallet
<b>Receive Signature Request</b>	G-LUC-RECSIGNREQ	CREDENTIAL Wallet
<b>Sign Document</b>	G-LUC-SIGNDOC	External Signature Service
<b>Receive Signed Document</b>	G-LUC-RECSIGNDOC	External Signature Service
<b>Recognize Externally triggered</b>	G-LUC-REEXTTRIGEVEN	CREDENTIAL Wallet

Use Case Name	Unique ID	Main Actor
<b>Event</b>		
<b>Evaluate Notification Configuration</b>	G-LUC-EVALNOTIFYCONF	CREDENTIAL Wallet
<b>Create Notification List</b>	G-LUC-CREATENOTIFYLIST	CREDENTIAL Wallet
<b>Send Notification</b>	G-LUC-SENDNOTIFY	CREDENTIAL Wallet
<b>Process Notification</b>	G-LUC-PROCNOTIFY	CREDENTIAL Wallet
<b>Create Delete Data Request</b>	G-LUC-CREATEDELDATAREQ	CREDENTIAL Participant's IT-System
<b>Submit Delete Data Request</b>	G-LUC-SUBMITDELDATAREQ	CREDENTIAL Participant's IT-System
<b>Delete Data</b>	G-LUC-DELDATA	CREDENTIAL Wallet
<b>Encrypt Data</b>	G-LUC-ENCDATA	CREDENTIAL Wallet
<b>Request Re-Encryption Key</b>	G-LUC-REQREK	CREDENTIAL Wallet
<b>Process Exception</b>	G-LUC-PROCEXC	CREDENTIAL Wallet

Table 9: Generic Data Management LUCs

### 3.2.2.2 Authentication

The generic BUCs related to authentication are covered by the following 25 generic LUCs.

Use Case Name	Unique ID	Main Actor
<b>Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and a CREDENTIAL-enabled IdP</b>	G-LUC-AUTHSPUSINGWALLETENABLEDIDP	CREDENTIAL Participant
<b>Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and a IdP</b>	G-LUC-AUTHSPUSINGWALLETIDP	CREDENTIAL Participant
<b>Authenticate towards CREDENTIAL Wallet using CREDENTIAL-enabled IdP</b>	G-LUC-AUTHWALLETUSINGENABLEDIDP	CREDENTIAL Participant
<b>Authenticate towards CREDENTIAL Wallet using an external IdP</b>	G-LUC-AUTHWALLETUSINGEXTERNALIDP	CREDENTIAL Participant
<b>Select CREDENTIAL Identity Provider</b>	G-LUC-SELECTCREDIDP	CREDENTIAL Participant
<b>Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and Identity Federation</b>	G-LUC-AUTHSPUSINGWALLETANDIDENTITYFEDERATION	CREDENTIAL Participant
<b>Attributes Collection</b>	G-LUC-ATTCOLLECTION	Identity Provider
<b>Request Identity Assertion</b>	G-LUC-REQIDENTITYASSERTION	Service Provider
<b>Re-Encrypt Attributes</b>	G-LUC-ENCATTRIBUTES	Identity Provider
<b>Issue Identity Assertion</b>	G-LUC-ISSIDENTITYASSERTION	Identity Provider
<b>Receive Identity Assertion</b>	G-LUC-RECIDENTITYASSERTION	Service Provider
<b>Decrypt Identity Assertion</b>	G-LUC-DECIDENTITYASSERTION	Service Provider
<b>Create Logout Request</b>	G-LUC-CREATELOGOUTREQ	CREDENTIAL Participant's IT-System
<b>Submit Logout Request</b>	G-LUC-LOGOUTCREDWALLET	CREDENTIAL Participant's IT-System
<b>Invalidate Session</b>	G-LUC-INVSESSION	CREDENTIAL Wallet
<b>Respond Successfully Logout</b>	G-LUC-RESPSUCCLOGOUT	CREDENTIAL Wallet
<b>User Authentication using IdP</b>	G-LUC-XYZ	CREDENTIAL Participant
<b>Ask for a List of IdPs</b>	G-LUC-ASKIDPS	IdP Selector

Use Case Name	Unique ID	Main Actor
<b>Ask to select an IdP from the provided List</b>	G-LUC-ASKIDPFROMLIST	CREIDENTIAL Participant
<b>Select an IdP</b>	G-LUC-SELECTIDP	CREIDENTIAL Participant
<b>IdP Selector Redirects User to the Selected IdP</b>	G-LUC-REDIRECTUSER	IdP Selector
<b>Select Attributes to Disclose</b>	G-LUC-SELECTATTRDISCLOSE	CREIDENTIAL Participant
<b>Redact Identity Assertion</b>	G-LUC-REDACTIDASSERTION	CREIDENTIAL Redactor Service
<b>Provide Identity Assertion</b>	G-LUC-PROVIDASSERTION	CREIDENTIAL Participant's IT-System
<b>Verify Identity Assertion</b>	G-LUC-VERIDASSERTION	Service Provider

Table 10: Generic Authentication LUCs

### 3.2.2.3 Authorization

The generic BUCs related to authorization are covered by the following 11 generic LUCs.

Use Case Name	Unique ID	Main Actor
<b>Request Access Rights</b>	G-LUC-REQACCESSRIGHTS	Service Provider
<b>Register Access Rights Request</b>	G-LUC-REGACCESSRIGHTSREQ	CREIDENTIAL Authorization Service
<b>Provide Access Rights Request</b>	G-LUC-PROVACCESSRIGHTSREQ	CREIDENTIAL Authorization Service
<b>Define Access Rights</b>	G-LUC-DEFINEACCESSRIGHTS	CREIDENTIAL Participant's IT-System
<b>Grant Access Rights</b>	G-LUC-GRANTACCESSRIGHTS	CREIDENTIAL Participant's IT-System
<b>Provide Access Rights</b>	G-LUC-PROVIDEACCESSRIGHTS	CREIDENTIAL Participant's IT-System
<b>Register Access Rights</b>	G-LUC-REGACCESSRIGHTS	CREIDENTIAL Authorization Service
<b>Verify Re-Encryption Request</b>	G-LUC-VERREENCREQ	CREIDENTIAL Wallet
<b>Request Access Rights List</b>	G-LUC-REQACCRIGHTSLIST	CREIDENTIAL Participant's IT-System
<b>Receive Access Rights List</b>	G-LUC-RECACCESSRIGHTSLIST	CREIDENTIAL Participant's IT-System
<b>Access Denied</b>	G-LUC-ACCESSDENIED	CREIDENTIAL Authorization Service

Table 11: Generic Authorization LUCs

### 3.2.2.4 Account Management

The generic BUCs related to authentication are covered by the following 35 generic LUCs.

Use Case Name	Unique ID	Main Actor
<b>Register Link Account Request</b>	G-LUC-REGLINKACCREQ	CREIDENTIAL Wallet
<b>Generate new Keypair</b>	G-LUC-GENKEYPAIR	CREIDENTIAL Participant's IT-System
<b>Create Link Account Request using CREIDENTIAL</b>	G-LUC-LINKACCREQ	Service Provider
<b>Redirect User to CREIDENTIAL Authentication</b>	G-LUC-REDIRECTUSERCREDAUTH	Service Provider
<b>Provide Link Account Request</b>	G-LUC-PROVLINKACCREQ	CREIDENTIAL Participant's IT-System
<b>Authorization</b>	G-LUC-AUTHORIZATION	CREIDENTIAL Wallet
<b>Search User</b>	G-LUC-SEARCHUSER	CREIDENTIAL Wallet
<b>Create De-Register CREIDENTIAL account request</b>	G-LUC-CREATEDEREGACCREQ	CREIDENTIAL Participant's IT-System
<b>Submit De-Register CREIDENTIAL account request</b>	G-LUC-SUBMITDEREGACCREQ	CREIDENTIAL Participant's IT-System
<b>De-Register Account</b>	G-LUC-DEREGACC	CREIDENTIAL Wallet

Use Case Name	Unique ID	Main Actor
<b>Create new CREDENTIAL Account Request</b>	G-LUC-CREATECREDACCREQ	CREDENTIAL Participant's IT-System
<b>Submit new CREDENTIAL Account Request</b>	G-LUC-SUBMITCREDACCREQ	CREDENTIAL Wallet
<b>Create new CREDENTIAL Account</b>	G-LUC-CREATECREDACC	CREDENTIAL Wallet
<b>Create List Previous Logins Request</b>	G-LUC-CREATELISTPREVLOGREQ	CREDENTIAL Participant's IT-System
<b>Submit List Previous Logins Request</b>	G-LUC-SUBMITLISTPREVLOGREQUEST	CREDENTIAL Wallet
<b>Query List of Previous Logins for User</b>	G-LUC-QRYLISTPREVLOGINS	CREDENTIAL Wallet
<b>Return List of Previous Logins</b>	G-LUC-RETLISTPREVLOGINS	CREDENTIAL Wallet
<b>Create Ban a User Request</b>	G-LUC-CREATEBANUSERREQ	CREDENTIAL Participant's IT-System
<b>Submit Ban a User Request</b>	G-LUC-SUBMITBANUSERREQ	CREDENTIAL Participant's IT-System
<b>Ban User</b>	G-LUC-BANUSER	CREDENTIAL Wallet
<b>Submit Unban a User Request</b>	G-LUC-SUBMITUNBANUSERREQ	CREDENTIAL Participant's IT-System
<b>Unban User</b>	G-LUC-UNBANUSER	CREDENTIAL Wallet
<b>Create Export Data Request</b>	G-LUC-CREATEEXPORTDATAREQ	CREDENTIAL Participant's IT-System
<b>Submit Export Data Request</b>	G-LUC-SUBEXPDATAREQ	CREDENTIAL Participant's IT-System
<b>Return Exported Data</b>	G-LUC-RETEXPDATA	CREDENTIAL Wallet
<b>Create View All Accesses Request</b>	G-LUC-CREATEVIEWACCESSESREQ	CREDENTIAL Participant's IT-System
<b>Submit View All Accesses Request</b>	G-LUC-SUBMITVIEWACCESSESREQ	CREDENTIAL Participant's IT-System
<b>Search All Accesses</b>	G-LUC-SEARCHACCESSES	CREDENTIAL Wallet
<b>Return List of All Accesses</b>	G-LUC-RETLISTALLACCESSES	CREDENTIAL Wallet
<b>Associate new Keypair</b>	G-LUC-ASSOCKEYPAIR	CREDENTIAL Wallet
<b>Generate Update Re-Encryption Key</b>	G-LUC-GENUPDREENCKEY	CREDENTIAL Participant's IT-System
<b>Generate Re-Encryption Request</b>	G-LUC-GENREENCREQ	CREDENTIAL Participant's IT-System
<b>Data Registration Confirmed</b>	G-LUC-DATAREGCONF	CREDENTIAL Wallet
<b>Create Recovery Request</b>	G-LUC-CREATERECREQ	CREDENTIAL Participant's IT-System
<b>Submit Recovery Request</b>	G-LUC-SUBMITRECOVREQ	CREDENTIAL Participant's IT-System
<b>Export Private Key</b>	G-LUC-EXPPRIVKEY	CREDENTIAL Participant's IT-System
<b>Import Private Key</b>	G-LUC-IMPPRIVKEY	CREDENTIAL Participant's IT-System

Table 12: Generic Account Management LUCs

## 4 Pilot domains: eGovernment, eHealth, eBusiness

This section explains how the three different pilots adopt the generic use cases. We start with a generic introduction and background information for each domain where state of the art technology and stakeholders are introduced. Every pilot explains how it can benefit by using CREDENTIAL technology and highlight how the CREDENTIAL Wallet could impact the current solutions. Afterwards each pilot defines storyboards and derives business use cases from them. Logical use cases associated to single business use cases will be described in D6.1.

### 4.1 eGovernment

eGovernment consists of the introduction of ICT technologies into Public administrations for providing services in a more innovative and usable way. The level of interaction depends on different involved actors. This could be between citizens and government, or between different public authorities, or between government and business/industrial world.

One of the main goal of eGovernment is to provide to the citizen a portfolio of improved public services from the point of view of accessibility, cost-effectiveness, efficiency, transparency and security. Many of these public services require the digital identity of the citizen to perform personal identification (authentication) and access rights assessment (authorisation). The citizen digital identity is the electronic representation of citizen's personal information.

In the context of CREDENTIAL Project the eGovernment use case takes place in Lombardy Region. Lombardy Region is a large Italian Region with over 10 million of citizens. Since 2007, all the Lombardy citizens are able to access to the eGovernment services using a digital identity, consisting of a Regional Authentication Card (CRS) and nowadays a National Authentication Card (CNS). The access is regulated by an identity provider named IdPC (Identity Provider of the Citizen).

Every year the Regional IdP (IdPC) provides about 8 millions of authentication for over 200 different Regional services.

The authentication is provided using the smartcard (the so called "CNS", National Card of Services) owned by each citizen living in Lombardy Region. Every CNS is associated to a PIN/PUK code. Since 2012 for some specific services (mainly eHealth environment) it is also available a One Time Password system, based on a multi-factor authentication scheme (username+password → something user knows; and SMS/OTP → something user has) to enhance the authentication service usability for end users and the security of the overall IAM service.

The IdPC "Identity Provider Cittadino" is a SAML 1.1/2.0 Identity Provider widely integrated in Lombardy Region and Italy. It is developed and hosted by LISPA. IdPC offers various types of authentication methods according to the level of security needed by the service requiring the authentication: CNS smartcard and PIN; username and password; username, password and OTP/SMS; OAUTH2 paradigm (Q3 2016).

Currently, at national level, there is a large project, called SPID (Public system of digital identity), aiming at federating identity and service providers. SPID is actually a national network, gathering identity and service providers, assuring they conform to a set of given rules and standards.

The ultimate goal of the project is to give a "digital identity" to all Italian citizens. Every service provider has to decide the level of the authentication required to gain an access; SPID defines three different level of authentication: L1 (username and password), L2 (username, password and a third factor,

i.e. SMS/OTP), L3 (CNS smart card). Every domain will have its correct level, i.e. eHealth services will be typically accessible via L2 or L3 authentication factor. The SPID project confirms the great interest and competence of Italy in the digital identity.

#### 4.1.1 Stakeholders

It is useful considering UCs stakeholders and their needs, with the goal of better fitting Identity Cloud Wallet, providing answers to their identified needs. Hence we identify the stakeholders of our pilot highlighting the interest they may have in the application of IAM innovative solutions.

To better understand where the different stakeholders of CREENTIAL solutions are placed we stratify the environment in three levels as three concentric circles (see figure below): 1) the internal environment; 2) the near environment; 3) the far environment.

1. **Internal environment.** It is inside the organization’s boundaries and it is made up of the resources available for doing business. It is common saying that the organization controls this environment and it should (even if it is not always that straightforward). In the case of CREENTIAL, the organization is actually the consortium of several organizations providing solutions of security and privacy for services offered on the cloud.
2. **Near environment.** It is outside the organization’s boundaries and includes customers, suppliers, business partners as well as competitors. This environment cannot be controlled by the organization; it should be influenced. A deeper analysis should allow the project team to have a good understanding of the actors playing on the near environment’s stage.
3. **Far environment.** Far environment usually includes factors that cannot be neither controlled nor influenced, such as the ones usually referred to as STEEP factors (Social, Technological, Economic, Environmental, Political).

In the following table we list the stakeholders and their interests in the project results. Then we will fit those stakeholders into the appropriate “environment” categories.

The table shows the list of stakeholders and the interest they have on CREENTIAL project. These stakeholders are labelled as actors if they have been identified as business actors – human and/or legal – (see later on in the business use cases description).

Stakeholder	Interest in project’s results	Actor
<b>Local Public Bodies</b>	More secure Identity management for Local Public Bodies service. Local Public Bodies could enrich the citizen Credential Wallet with certified data. So the citizen could share certified data (attribute) in different services.	Y
<b>Regional Governments</b>	More secure Identity management for regional service.	Y
<b>SW Developers</b>	They may take advantage of increased workload deriving from the development of new cloud-based solutions fostered by improved security environments.	N
<b>Law Enforcement Authorities</b>	They may access evidences gathered and stored in secured cloud environments.	N

Stakeholder	Interest in project's results	Actor
<b>Citizens</b>	Improved privacy control. More services available thanks to improved security (easier to cope with Privacy regulations).	Y
<b>Cloud Provider</b>		N
<b>Service Provider</b>	Business opportunities coming from the diffusion of cloud solutions. For many SP could be an opportunity obtain directly sure and certified data.	Y
<b>External Auditors</b>	When certifying IT infrastructure, they need solutions that make their work easier.	N
<b>Researchers</b>	Easier access to anonymized data.	N
<b>Internet Service Providers</b>	Business opportunities coming from the diffusion of cloud solutions.	N
<b>Private Companies</b>	Competitors	N
<b>Certification Authorities</b>	Business opportunities coming from the diffusion of cloud solutions.	N

Table 13: eGovernment pilot stakeholders

In the following picture, the stakeholders identified in previous table, are classified into the respective environments.

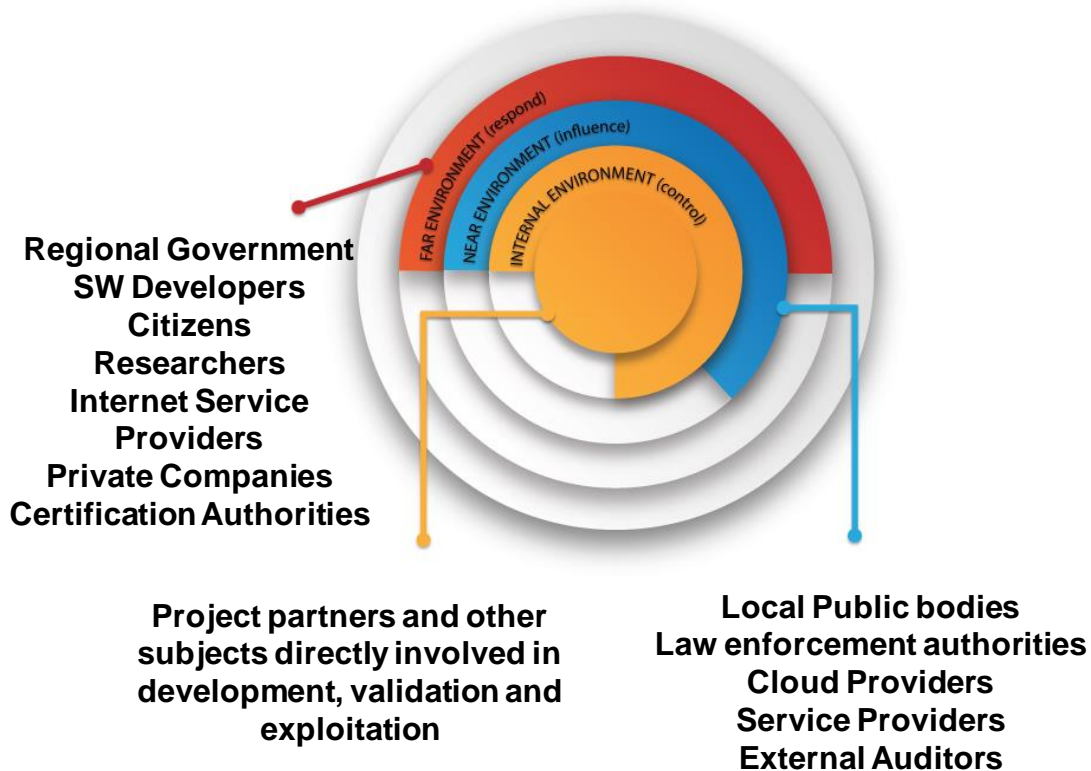

Figure 4: Environment Framework

### 4.1.2 State of Art

Authentication and authorisation are two different steps into the identification process: the first refers to the process of ascertaining that somebody is who he claims to be; the second refers to rules defining who is allowed to do what. The digital identity, within the eGovernment context, is provided and managed by a digital identity and access management framework (IAM).

In Lombardy Region the eGovernment digital identity and access management framework - as far as the CREDENTIAL use cases are concerned - is composed by:

- IdPC
- SIAGE (for a Lombardy Citizen or a Spanish Citizen living in Lombardy)
- Spanish eGovernment web site (for a Lombardy Citizen living in Spain)

Within the CREDENTIAL project a pilot will be carried out in a specific Lombardy Region environment based on the IdPC.

Two use cases are interacting with the SIAGE service and one with the Spanish eGovernment web site.

SIAGE service is based on the Lombardy Region IAM and it is accessible only through the component Lombardy IdPC to citizens who own the CNS smartcard.

In particular, the SIAGE service is based on the following requirements:

- Citizens should own Italian eID card
- Citizens access directly to services and authenticate when they enter the access phase
- Authentication is based on “chip&pin” paradigm
- The services delegate to the centralized regional service (Identity Provider Cittadini) the identification of the citizen
- Identity Provider uses standard SAML 1.1 & SAML 2.0

SIAGE service, as it is nowadays, is not accessible through other Identity providers and does not provide the opportunity to retrieve requested information which are not included into the Lombardy region IdPC assertions. In the near future an integration with SPID national system is foreseen.

The current version of SIAGE platform can be accessed in two ways. A first option requires the user's CRS/CNS, hence involving strong authentication. Anyway, after the first authentication, the user receives ID and password allowing him to enter the service again without strong authentication; the final submission of tender documents requires the attachment of digitally signed documents. The reason for that is to enhance the system's usability for users who need to enter the system several times as they are dealing with a tender. In the second option the authentication is carried out without strong authentication and in order to receive ID and password, a user has to send paper documents by mail.

For these reasons some scenario has been identified and pilot Uses Cases have been designed for the integration of CREDENTIAL Wallet into SIAGE service and IdPC. The integration of CREDENTIAL Wallet into IdPC is also foreseen for the application to the use case related to Spanish eGovernment web site.

The state of the art of Lombardy Region scenario is represented in the following picture where the access to SIAGE service provider is nowadays possible through the Lombardy Region Identity Provider (IdPC) or through the National IdP (SPID).

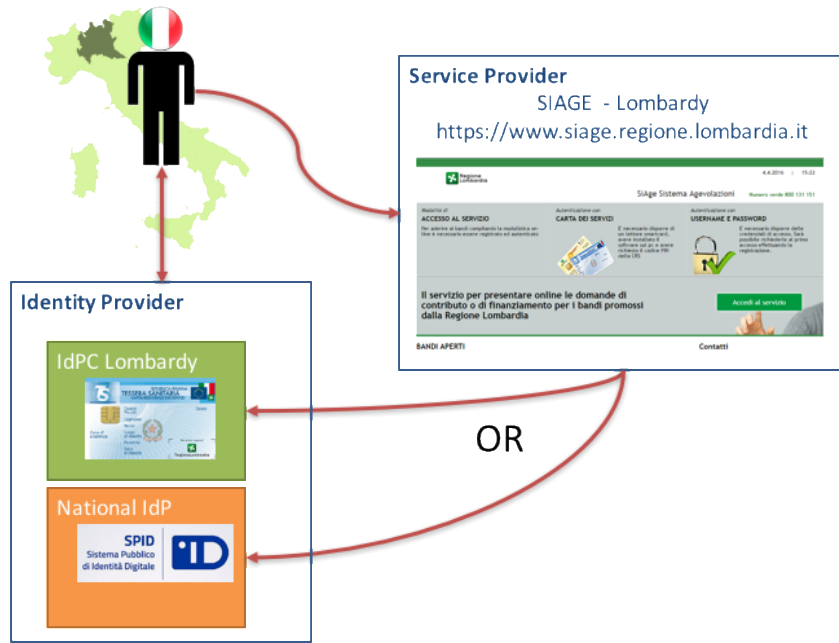

Figure 5: State of the art scenario in Lombardy Region

The above represented scenario can evolve into a more advanced system with added features of the CREDENTIAL Wallet. The access to different service providers (e.g. SIAGE in Lombardy region or a foreign service provider in other countries) is possible through the integration of existing Identity providers and the CREDENTIAL Wallet to Lombardy citizen and to foreigners.

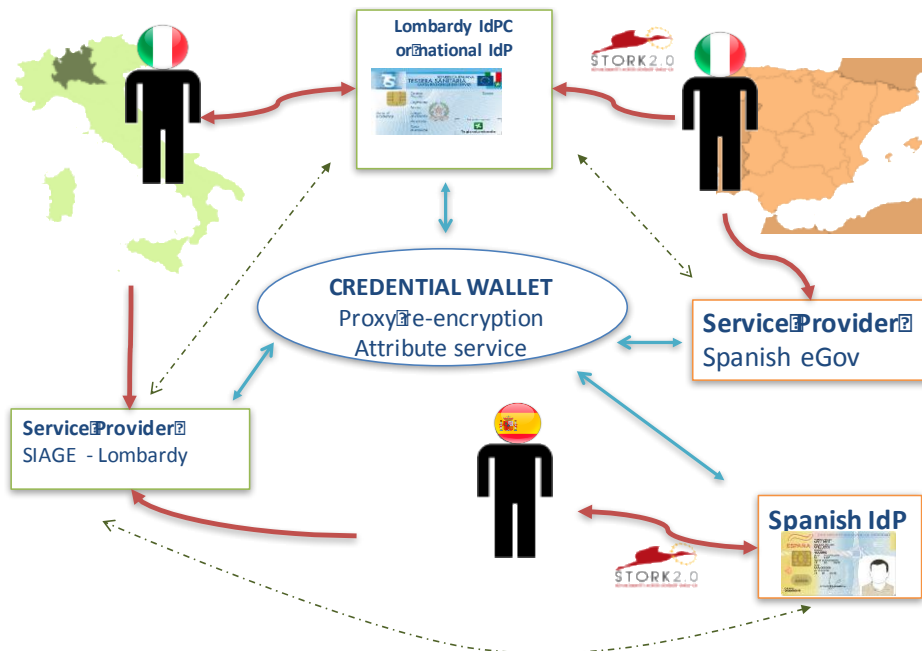

Figure 6: Lombardy Region scenario with CREDENTIAL added values

### 4.1.3 Value Proposition

The added value of introducing CREDENTIAL solution into the state of the art authentication process for accessing the SIAGE service provider in Lombardy Region is analyzed for each actor/stakeholder.

Actor / Stakeholder	Before	Benefit using CREDENTIAL
<b>Citizen (Lombardy or foreigner)</b>	<p>The citizen’s authentication can only happen through Lombardy IDPC The citizen has no control on his digital identity data (can’t apply any disclosure)</p> <p>SP usage is possible with local IdP usage (i.e. Italian SP requires Italian IdP)</p>	<ul style="list-style-type: none"> <li>• The citizen can access using several IDPs</li> <li>• The citizen takes control of his digital identity (can also certify data)</li> <li>• The wallet provides that the data provided actually belongs to the citizen and are certified (either by the citizen himself or by the public provider)</li> <li>• Public administrations could provide the Wallet with further certified data</li> <li>• SP accessible with every IdP: the user data not released by IdP can be found in Wallet and used to enrich SAML assertion</li> <li>• Encryption level is improved thanks to proxy re-encryption and wallet</li> </ul>
<b>IdPC (Identity Provider)</b>	<p>Access through the Regional Identity Provider or the National Identity Provider using smartcard for authentication without the opportunity to retrieve or save other identity data</p>	<ul style="list-style-type: none"> <li>• Encryption level is improved thanks to the wallet</li> </ul>
<b>SIAGE (Service Provider)</b>	<p>SIAGE service, as it is nowadays, is not accessible through other Identity providers then the Lombardy IDPC. SIAGE does not provide the opportunity to retrieve requested information which are not included into the Lombardy region IdPC assertions.</p>	<ul style="list-style-type: none"> <li>• SIAGE platform allows authentication using several IDPs</li> </ul>

Table 14: Value Proposition of eGovernment Pilot

### 4.1.4 Business Actors

eGovernment business actors are summarized in the following tree structure and detailed hereafter.

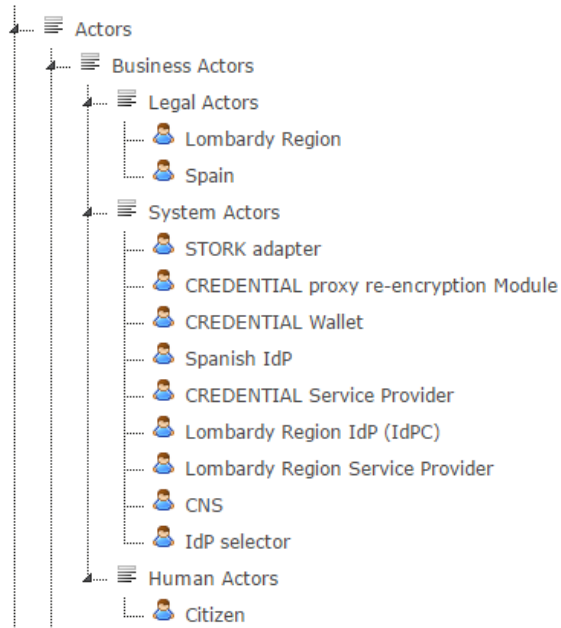

Figure 7: eGovernment business actors

#### 4.1.4.1 Human Actors

**Citizen** - A natural person. An Italian citizen is anyone with a fiscal code<sup>12</sup>. The fiscal code is an alphanumeric unique id that identifies every citizen in Italy. Fiscal code is the key to access to almost every Italian service provider designed for a citizen access over the Internet. From the identity point of view, citizen could be a citizen or a public employee. If she/he is a public employee, the attribute is into the service and not directly linked (stored) into the digital identity. The citizen uses a set of "credentials" released by an Identity Provider in order to access a service provider. A Lombardy Region citizen is a citizen who lives in Lombardy Region for 6 months at least. A Lombardy Region citizen can have multiple identities in the CREDENTIAL network:

- a digital identity released by IdPC,
- a digital identity released by another Identity Provider (or Issuer of credentials) into the CREDENTIAL network.

The identities above can be used to access a Lombardy Region service provider or another service provider into the CREDENTIAL network.

#### 4.1.4.2 System Actors

---

12

[http://www.agenziaentrate.gov.it/wps/content/Nsilib/Nsi/Home/CosaDeviFare/Richiedere/Codice+fiscale+e+tessera+sanitaria/Richiesta+TS\\_CF/Scheda/Informazioni+codificazione+pf/](http://www.agenziaentrate.gov.it/wps/content/Nsilib/Nsi/Home/CosaDeviFare/Richiedere/Codice+fiscale+e+tessera+sanitaria/Richiesta+TS_CF/Scheda/Informazioni+codificazione+pf/)

**STORK Adapter** - The STORK adapter is the component responsible to manage browser redirection and protocol adjustments during the user authentication into a SP using a *foreign* IdP (i.e. login into a Spanish SP using an Italian IdP).

**CREDENTIAL Proxy Re-Encryption** - A collection of libraries, web services, browser plug-ins etc. which makes available a proxy re-encryption. Decrypt functions are also available.

**CREDENTIAL Wallet** - CREDENTIAL Wallet contains user specific data. All data is stored in an encrypted mode. Only a user's private key is able to decrypt this data. User data could be sensitive, personal, or generic. The Wallet offers web services to applications in order to store and retrieve user data. The Wallet also offers user interfaces to view and maintain data.

**Spanish IdP** - A Spanish CREDENTIAL Identity Provider is a SAML 2.0 Identity Provider developed and hosted by a CREDENTIAL partner different from LISPA. It releases authentication to a citizen (even a Lombardy Region citizen). Assertion can be enriched with data stored in CREDENTIAL Wallet. The CREDENTIAL Identity Provider could be an "issuer of credential" itself.

**CREDENTIAL Service Provider** - A CREDENTIAL Service Provider offers services to Citizens on the Internet. It is not a Lombardy Region Service Provider. A Lombardy Region Citizen should access to a CREDENTIAL Service Provider, gaining an authentication token from IdPC or another Identity Provider joining CREDENTIAL network. The SAML 2.0 assertion released by Identity Providers implies that the CREDENTIAL Service Provider is equipped with a component (i.e. Shibboleth) responsible for the assertion verification.

**Lombardy Region IdP (IdPC)** - IdPC is a SAML 1.1/2.0 Identity Provider developed and hosted in Lombardy Region. This Identity Provider is running since 2007 and has released about 8 million authentications in 2015. It is integrated by hundreds of service providers in Lombardy Region and Italy. IdPC can negotiate user authentication in several manners, mainly: smartcard+PIN, ans username/password/OTP-SMS. In the CREDENTIAL project, the proposed authentication paradigm involves smartcard+PIN.

**Lombardy Region Service Provider** - The Lombardy Region service providers typically make available services specifically targeted for Lombardy Region citizens. The Lombardy Region service provider chosen for CREDENTIAL project is named "SIAGE" ("Sistema AGEvolazioni"). SIAGE makes available contributions, tax breaks and subsidies to Lombardy Region citizens - and companies - facing economic difficulties.

**CNS** - CNS is an acronym which stands for Carta Nazionale dei Servizi. It is a dual-interface smartcard, available for almost all Italian citizens. It contains an X.509 digital certificate with the purpose to authenticate the user during online transactions.

**IdP Selector** - This component allows the citizen to choose her/his preferred IdP for that authentication session. A citizen could have several digital identities released by several IdP (or issuer of credential).

#### 4.1.4.3 Legal Actors

**Lombardy Region** - Lombardy Region is one of the twenty Italian regions. Lombardy Region offers to its citizen several eGovernment and eHealth services over the internet.

**Spain** - Spain is one of the fifty European states. Like other countries, Spain offers to its citizen several kinds of services in the internet.

#### 4.1.5 Storyboards

As represented hereafter, the eGovernment scenario in Lombardy region would involve different types of actors interacting with some of the CREDENTIAL Wallet components. Figure 8 helps to depict all the involved actors in the eGovernment scenario and all the interactions between actors and credential components. In the orange box there is the Spanish context, in the green box there is the Lombardy Region context, the blue boxes include all the CREDENTIAL related components. Actors are highlighted according to their category: system, human, legal. Human actors have the head with the associated color (orange for Spain and green for Lombardy region).

Our eGovernment pilot include three different storyboards which are detailed in the following paragraphs:

- A Lombardy citizen living in Lombardy asks for a contribution from Lombardy Region through the SIAGE service provider;
- A Lombardy citizen living in Spain pays some taxes on a Spanish eGovernment website;
- A Spanish citizen living in Lombardy asks for a contribution from Lombardy Region through the SIAGE service provider.

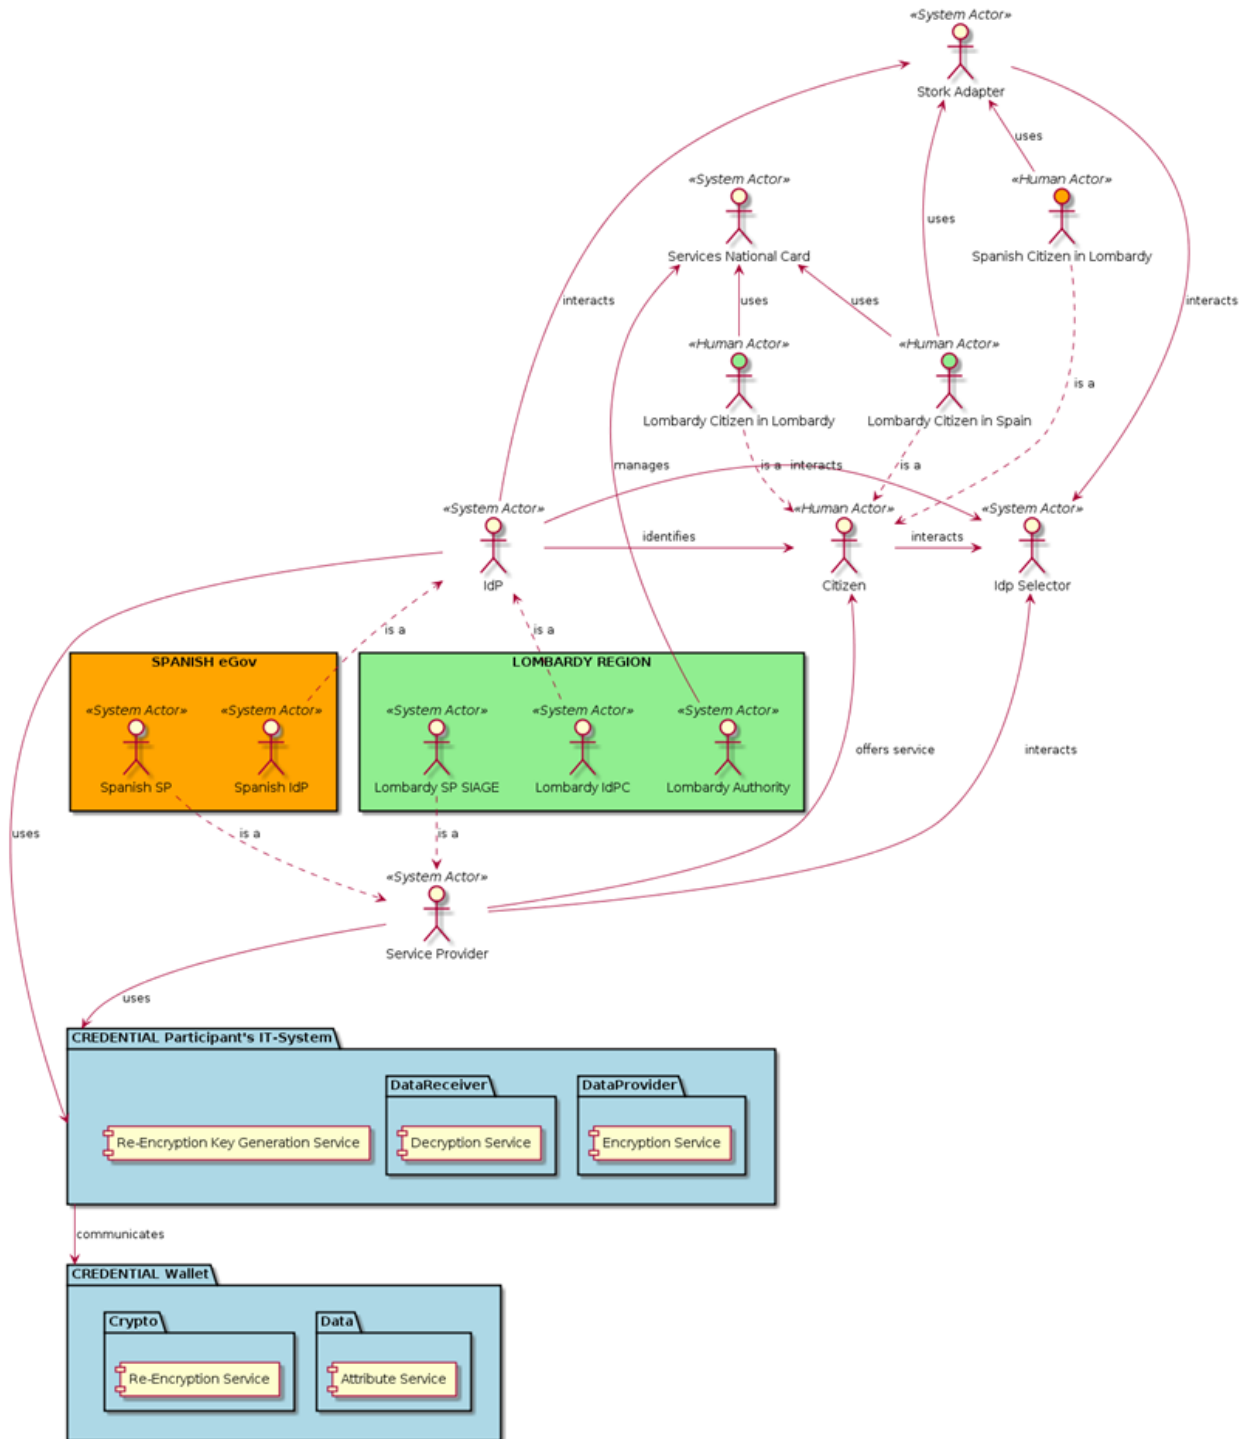

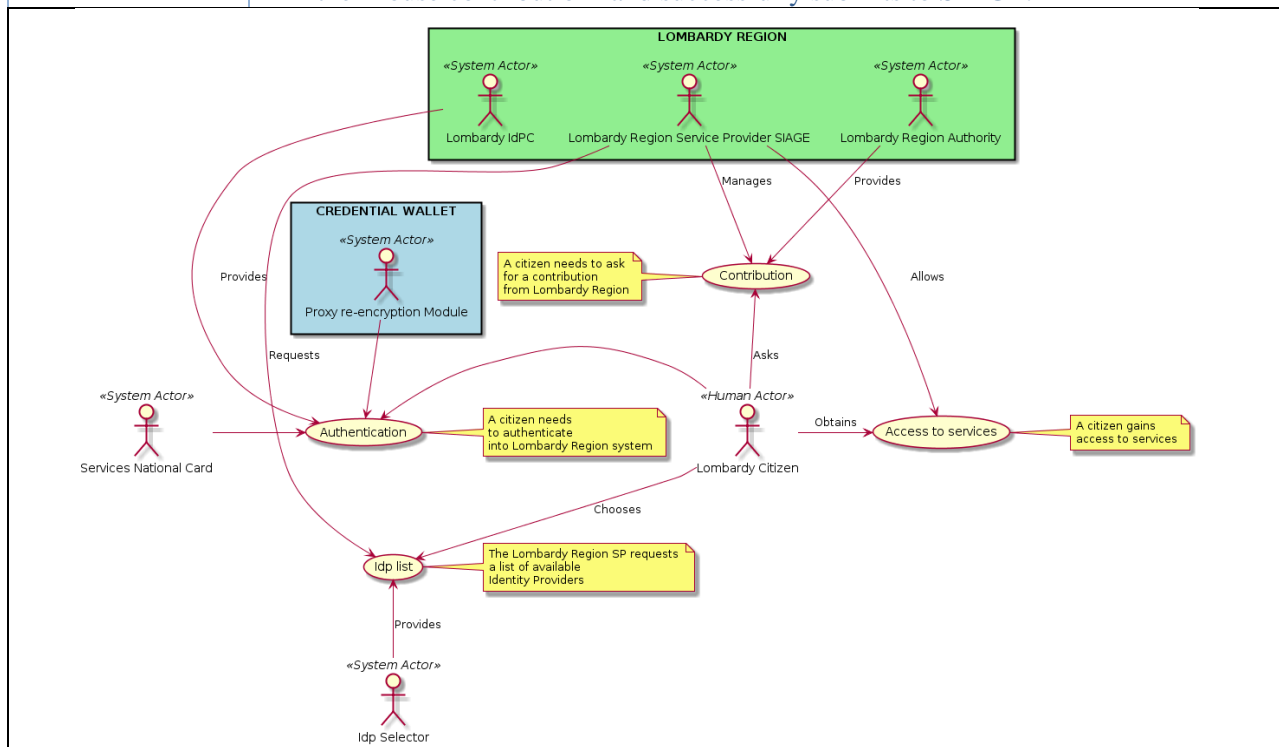

Figure 8: eGovernment actors and interactions

### 4.1.5.1 A Lombardy citizen asks for a contribution from Lombardy Region

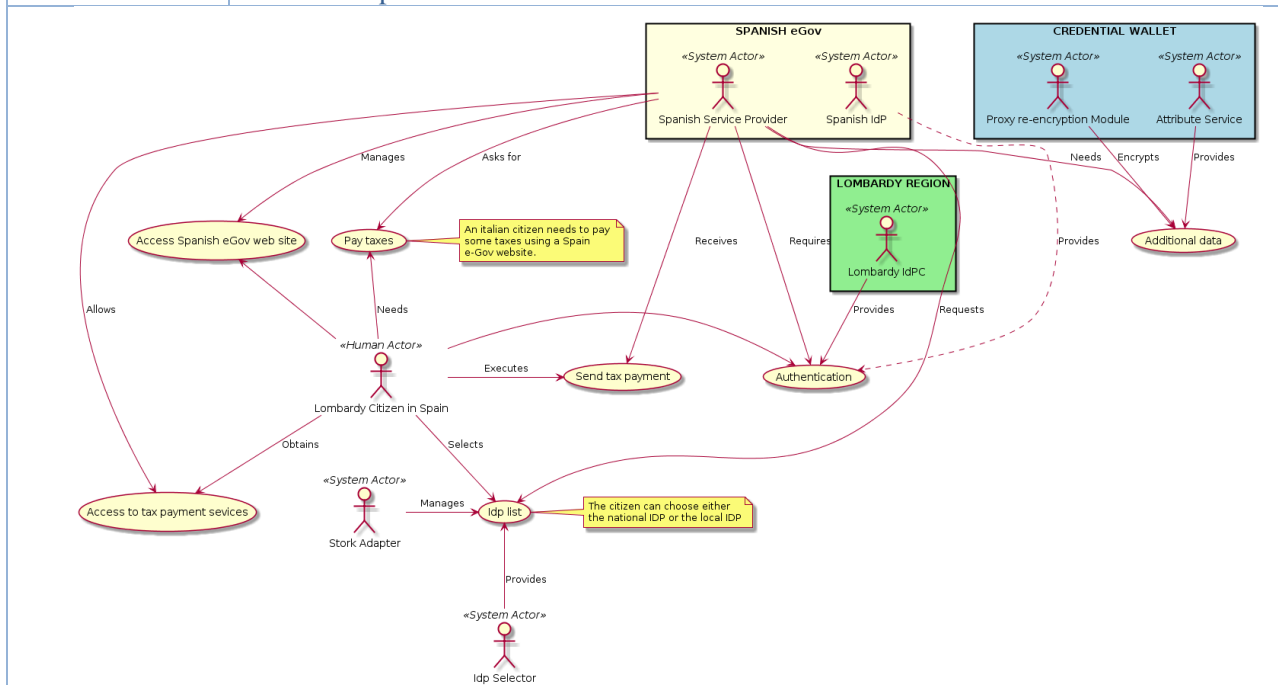

<b>Story Name</b>	<b>A Lombardy citizen asks for a contribution from Lombardy Region</b>
<b>ID</b>	E-GOV-S-LOMBARDYCTZNASKCONTRIBUTION
<b>Purpose</b>	Authenticate a Lombardy citizen to a Lombardy Regional Service (SIAGE) using IdPC, the Lombardy Region Identity Provider.
<b>Human Actor</b>	Citizen
<b>System Actors</b>	<ol style="list-style-type: none"> <li>1 Lombardy Region IdP (IdPC)</li> <li>2 Lombardy Region Service Provider</li> <li>3 IdP selector</li> <li>4 Proxy re-encryption module of Credential wallet</li> <li>5 CNS services national card</li> </ol>
<b>Legal Actors</b>	Lombardy Region
<b>Pre-conditions</b>	Citizen has the capability to gain authentication from IdPC; in other words, citizen has a CNS smartcard, its PIN, and a smartcard reader.
<b>Post-conditions</b>	The citizen is authenticated to IdPC and can access to Lombardy Regional Service (SIAGE)
<b>Scenario</b>	<p>Antonio, a Lombardy citizen who lives in Bergamo, has problem to pay the house rent. Antonio wants to ask a contribution from Lombardy Region. Lombardy Region makes available a web site for this kind of requests, named SIAGE.</p> <p>He wants to use his Lombardy Id - in other words, his CNS.</p> <p>Antonio tries to access to an SIAGE protected by authentication request; the system asks the user to choose from a list of IdP; Antonio selects IDPC. Antonio proceeds with the authentication and confirms the mandatory data for access to SIAGE (Name, Family Name and Italian Fiscal Code). Note that he could have selected optional data collected into the CREDENTIAL Wallet in order to transmit them too.</p> <p>Antonio obtains the authentication and now could fulfill the form for requesting the "house contribution" and successfully submits to SIAGE.</p>

### 4.1.5.2 A Lombardy citizen pays some taxes on a Spanish eGovernment website

<b>Story Name</b>	<b>A Lombardy citizen pays some taxes on a Spanish eGovernment website</b>
<b>ID</b>	E-GOV-S- LOMBARDYCTZNPAYSTAXES
<b>Purpose</b>	Authenticate a Lombardy citizen to a CREDENTIAL Service Provider using IdPC.
<b>Human Actor</b>	Citizen
<b>System Actors</b>	<ol style="list-style-type: none"> <li>1 CREDENTIAL Service Provider</li> <li>2 Lombardy Region IdP (IdPC)</li> <li>3 Spanish IdP</li> <li>4 CREDENTIAL Wallet</li> <li>5 STORK Adapter</li> </ol>
<b>Legal Actors</b>	Spain
<b>Pre-conditions</b>	Citizen has the capability to gain an authentication from the IdPC (or from an external CREDENTIAL Identity Provider). Being a Lombardy citizen, it is highly likely that citizen would use Lombardy Id (his CNS).
<b>Post-conditions</b>	The citizen is authenticated to the CREDENTIAL Service Provider (Spanish eGovernment website).
<b>Scenario</b>	<p>Danilo, a Lombardy citizen who works and lives in Madrid, needs to pay some local taxes on a Spanish website. In order to perform this operation, a strong authentication is required. Danilo chooses the taxes he has to pay and just before payment the website requires authentication. The user browser shows several authentication systems. Danilo chooses IdPC. The user insert his CNS into the smartcard reader and digits its PIN. IdPC performs authentication; according to CREDENTIAL paradigm, the user data into the assertion are crypted. The user also adds some optional data, stored in CREDENTIAL Wallet, to speed up the buying procedure (i.e. his complete address in Spain, and NIF - Numero de Identificacion Fiscal). All data is transferred to the website, then Danilo uses his credit card and the taxes are correctly paid.</p> <p>Danilo could have used a Spanish identity released by a Spain IdP to perform the same operation.</p>

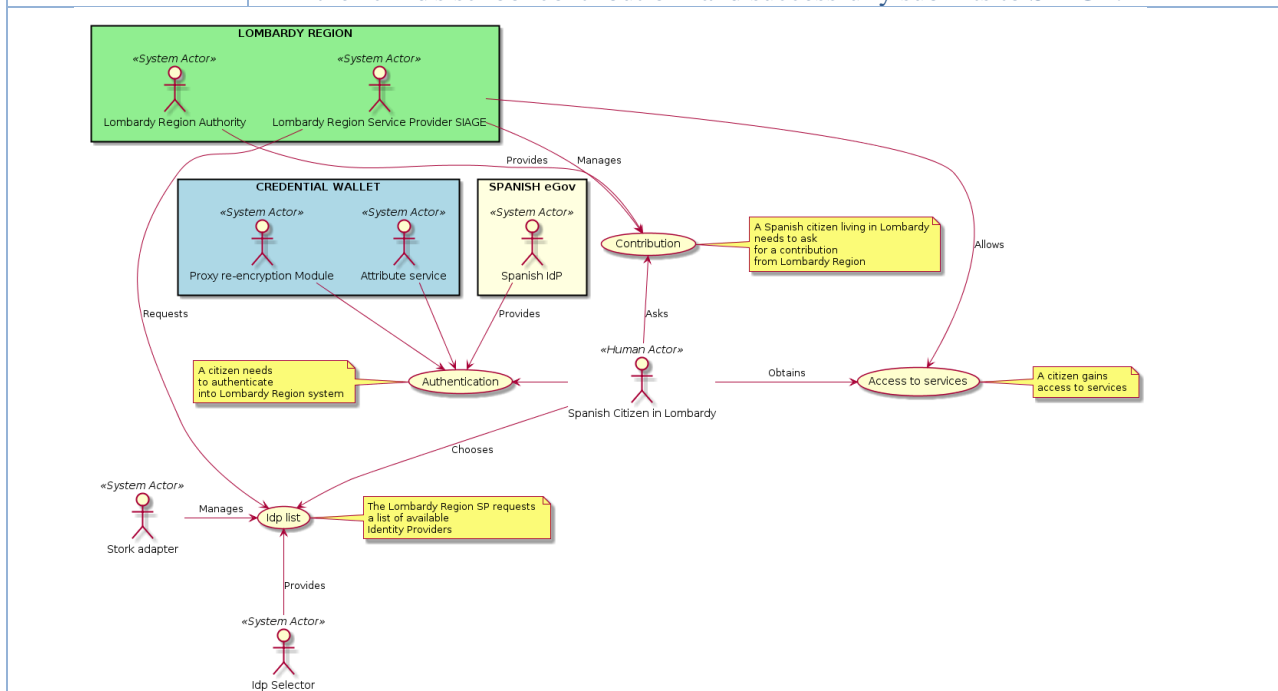

### 4.1.5.3 A Spanish citizen asks for a contribution from Lombardy Region

<b>Story Name</b>	<b>A Spanish citizen asks for a contribution from Lombardy Region</b>
<b>ID</b>	E-GOV-S- SPANCTZNASKCONTRIBUTION
<b>Purpose</b>	Authenticate a Spanish citizen to a Lombardy Regional Service using a Spanish ID and a Spanish IdP.
<b>Human Actor</b>	Citizen
<b>System Actors</b>	<ul style="list-style-type: none"> <li>1 Lombardy Region Service Provider</li> <li>2 Spanish IdP</li> <li>3 CREDENTIAL Wallet</li> <li>4 STORK Adapter</li> </ul>
<b>Legal Actors</b>	Lombardy Region
<b>Pre-conditions</b>	<ul style="list-style-type: none"> <li>1 The Wallet has to be enriched with the Italian Fiscal Code</li> <li>2 Citizen has a Wallet account</li> <li>3 Citizen has a Spanish IdP account</li> </ul>
<b>Post-conditions</b>	Spanish citizen is correctly logged in Lombardy Region SP (SIAGE) using his Spanish Id
<b>Scenario</b>	<p>Cristiano, a Spanish worker, is transferred in Italy a year ago. He becomes dad and he would like obtain a contribution by Lombardy Region for the child's school. He has a fiscal code in Italy because he is living in Rho. He wants to use his Spanish digital identity to access to SIAGE to submit the contribution request.</p> <p>He wants to use his Spanish Id because he is confident in his national identity system and he is used to access other Spanish SP with the Spanish IdP.</p> <p>Cristiano access to SIAGE; the system asks for an authentication; user selects "CREDENTIAL IdP" and then "Spanish IdP".</p> <p>Cristiano proceeds with the authentication and choose between the attribute available into his CREDENTIAL Wallet the mandatory data for access to SIAGE (Italian Fiscal Code).</p> <p>Cristiano obtains the authentication and now can fulfill the form for requesting the "child's school contribution" and successfully submits to SIAGE.</p>

### 4.1.6 Business Use Cases

The three eGovernment storyboards are described specifically in 9 BUCs, which are formally defined in Appendix 1A.3.1. The following table provides an overview.

Use Case Name	Unique ID	Main Actor
<b>Citizen asks for a contribution from Lombardy Region</b>	E-GOV-BUC-ASKLOMBCONTRIB	Citizen
<b>Citizen authenticates and access to SP</b>	E-GOV-BUC-AUTHSP	Citizen
<b>Citizen pays some taxes using a Spain eGovernment website</b>	E-GOV-BUC-PAYTAX	Citizen
<b>Citizen chooses taxes to pay and try to access to SP</b>	E-GOV-BUC-ACCSP	Citizen
<b>Citizen performs authentication</b>	E-GOV-BUC-AUTHENT	Citizen
<b>Citizen pays taxes on Spanish eGovernment website</b>	E-GOV-BUC-COMPLETEPAYM	Citizen
<b>Foreign citizen looks for a contribution from Lombardy Region</b>	E-GOV-BUC-FOREIGNASKCONTRIB	Citizen
<b>Citizen gains on-line authentication</b>	E-GOV-BUC-FOREIGNAUTH	Citizen
<b>Citizen completes online request to SIAGE</b>	E-GOV-BUC-FOREIGNCOMPLCONTRIB	Citizen

Table 15: eGovernment specific BUCs

The following table now show which of the above BUCs are associated with which of the eGovernment story boards defined before.

	A Lombardy citizen asks for a contribution from Lombardy Region	A Lombardy citizen pays some taxes on a Spanish eGovernment website	A Spanish citizen asks for a contribution from Lombardy Region
<b>Citizen asks for a contribution from Lombardy Region</b>	✓		
<b>Citizen authenticates and access to SP</b>	✓		
<b>Citizen pays some taxes using a Spain eGovernment website</b>		✓	
<b>Citizen chooses taxes to pay and try to access to SP</b>		✓	
<b>Citizen performs authentication</b>		✓	
<b>Citizen pays taxes on Spanish eGovernment website</b>		✓	
<b>Foreign citizen looks for a contribution from Lombardy Region</b>			✓
<b>Citizen gains on-line authentication</b>			✓
<b>Citizen completes online request to SIAGE</b>			✓

Table 16: Relation of BUCs and story boards in the eGovernment pilot

## 4.2 eHealth

The increase of healthcare costs in nearly every country worldwide is closely linked to the increase in chronic diseases which e.g. in Germany make up 75% of the overall expenses in the statutory health insurance system<sup>13</sup>. Given the high potential for valuable effects and sustainability of solutions improving treatment and care in this domain, it was decided to focus the CREDENTIAL eHealth use case on treatment and monitoring of diabetes mellitus patients. As these patients receive treatment from many different specialist doctors a seamless exchange of medical data among these doctors is crucial for an efficient treatment and to prevent patients from complications and comorbidities.

### 4.2.1 Medical Background

The human body transforms ingested carbohydrate into glucose which is absorbed by body cells and then utilized by various parts of the body (esp. muscles). The hormone Insulin plays an important role in this glucose metabolism as it regulates blood sugar level and “unlocks” the cell walls for absorbing glucose.

Diabetes mellitus is a distortion of the glucose metabolism where glucose is not sufficiently absorbed due to missing insulin production (type-1) or due to modifications of the cell walls (type-2). Especially type-2 diabetes is a highly prevalent chronic disease (approx. 90% of the 7 million diabetes patients in Germany suffer from type-2).

Type-2 diabetes results when the body is unable to produce the amount of insulin it needs to convert food into energy or when it is unable to use insulin appropriately. Sometimes the body is actually producing more insulin than is needed by a person to keep blood glucose in a normal range. Yet blood glucose remains high, because the body's cells are resistant to the effects of insulin. Physicians and scientists believe that type-2 diabetes is caused by many factors, including insufficient insulin and insulin resistance. They increasingly believe that the relative contribution each factor makes toward causing diabetes varies from person to person.

While some people with type-2 diabetes can manage their diabetes with healthy eating and exercise, the doctor may need to also prescribe oral medications (pills) and/or insulin to help patients meeting their target blood glucose levels. Other drugs are on the horizon as well, as scientists work to improve the variety of medications to treat type-2 diabetes. Frequently physicians will prescribe one type of oral medication and discover it isn't really helping to control blood glucose that much. In the past, this would have meant that the patient would likely be put on insulin. Now, physicians can try another type of medication to see if it helps correct problems. Physicians often notice that a particular medication works well for a period of time and then begins to work less well for a patient. Now they can mix and match medications that work on different aspects of the diabetes problem to see if that will improve blood glucose control<sup>14</sup>.

---

<sup>13</sup> Deutsche Bank Research (2010): Telemedizin verbessert Patientenversorgung. Online: [https://www.dbresearch.de/MAIL/DBR\\_INTERNET\\_DE-PROD/PROD0000000000253251.pdf](https://www.dbresearch.de/MAIL/DBR_INTERNET_DE-PROD/PROD0000000000253251.pdf)

<sup>14</sup> Joslin Diabetes Center (2016): Oral Diabetes Medications Summary Chart. Online: [http://www.joslin.org/info/oral\\_diabetes\\_medications\\_summary\\_chart.html](http://www.joslin.org/info/oral_diabetes_medications_summary_chart.html)

Type-1 diabetes is an autoimmune disease, where the body - usually at a juvenile age - stops producing insulin. Therefore, type-1 patients are always treated with Insulin which they inject themselves.

#### 4.2.2 Stakeholders

As a chronic disease, diabetes mellitus is subject to statutory managed care programs (e. g. Disease Management Programs, Integrated Care Contracts). These programs are agreed between governmental bodies, payer organizations and/or provider associations. They are implemented by the single health insurers which make respective contracts with single healthcare provider organizations and/or patients. Such programs usually follow evidence-based clinical guidelines which are provided through medical associations. Such guidelines not only provide guidance to doctors but even define specific pathways a treatment shall follow. On top of this, a managed care program regulates the flow of information between doctors, health insurance and patients, defines specific diagnostics a patient shall regularly receive, and determines quality indicators which doctors shall implement. Managed care programs usually consider the patient as an active partner who not only receives additional benefits (e. g. certain diagnosis and training courses being paid by the health insurance) but also has duties in cooperating with doctors and being compliant to his individual treatment plan.

For the CREENTIAL eHealth use case, the considered stakeholders can directly be derived from the typical operational setting of a managed care program:

Stakeholder	Interest in project's results	Actor
<b>Medical Associations</b>	Define clinical guidelines based on evidence and good practice in diabetes treatment.	N
<b>Governmental Bodies</b>	Agree on managed care programs that define the operational and monetary framing for diabetes treatment.	N
<b>Payer Organizations</b>	Agree on managed care programs that define the operational and monetary framing for diabetes treatment.	N
<b>Provider Associations</b>	Agree on managed care programs that define the operational and monetary framing for diabetes treatment.	N
<b>Statutory Health Insurance</b>	Participate in the specific implementation of a managed care program. In the case of CREENTIAL a fictive structured Diabetes Prevention Program based on the German S3 guidelines on Diabetes type-1 <sup>15</sup> and type-2 <sup>16</sup> therapy is considered.	Y

<sup>15</sup> <http://www.awmf.org/leitlinien/detail/ll/057-013.html>

<sup>16</sup> <http://www.awmf.org/leitlinien/detail/ll/nvl-001g.html>

Stakeholder	Interest in project's results	Actor
<b>Healthcare Providers</b>	Participate in the specific implementation of a managed care program. In the case of CREENTIAL a fictive structured Diabetes Prevention Program based on the German S3 guidelines on Diabetes type-1 and type-2 therapy is considered.	Y
<b>Patients</b>	High risk for diabetes or already in an early stage of diabetes may subscribe to such a program.	Y

Table 17: eHealth pilot stakeholders list

### 4.2.3 State of Art

#### *Diabetes Treatment*

The CREENTIAL eHealth use case will be designed to cover treatment for both type-1 and type-2 diabetes. Nevertheless, as the inclusion of children (which are a major group of type-1 diabetes patients) into the use case would impose the need to consider very specific and heterogeneous national legislation, a strong focus will be on type-2 patients.

A major cause for diabetes type-2 is hypertension even though the concrete developing of the disease is influenced by further factors (e.g. nutrition, genetic disposition). Diabetes type-2 therapy starts with means for changing the patient's lifestyle and escalates into medication regimes only if this does not lead to a normalization of the blood sugar level. This results in a multi-staged therapy which is standardized in respective guidelines published by responsible diabetes medical associations:

- Therapy stage 1 (base therapy): education, physical activity, non-smoking
- Therapy stage 2 (Pharmaka-Monotherapy): adding a single medication
- Therapy stage 3 (Insulin or combined medication): adding further medication
- Therapy stage 4 (intensive Insulin and medication): intensifying medication

The CREENTIAL eHealth use cases will follow these recommendations and therapy stages while utilizing CREENTIAL services for managing and sharing the various medical data that is collected from patients and created by physicians.

#### *Diabetes Diary*

Especially for patients who depend on insulin injections, the most important tool today is a diabetes diary where the patient records

- results of regular blood sugar measurements,
- carbohydrates consumed through meals,
- units of insulin injected.

While most patients still use a paper diabetes diary, mobile solutions are more and more being used due to their ability to automatically read data from glucometers which reduces the burden for the patient. Forthcoming solutions will even be able to read data from insulin pens<sup>17</sup>. For the CREDENTIAL eHealth use case we will not compete with such professional solutions, e. g. by implementing a diabetes diary in a secure cloud. Instead we will only record data which can be automatically provided by personal health devices (e. g. a glucometer or a scale). For the full diabetes diary we assume that the patient either records the required data on paper or uses a commercial mHealth App. Patients and doctors may transfer selected, aggregated data and diagrams from these Apps into the secure cloud that is used for the CREDENTIAL eHealth use case.

*Legal Foundation*

CREDENTIAL is well suited for the diabetes use case because it provides means for secure and privacy aware sharing of monitoring data through a cloud platform. By this it fulfils the regulatory constraints usually linked with the use of such platforms for health information exchanges; e.g.

- § 6(3) of the Austrian ELGA legislation<sup>18</sup> requests for state-of-the art data encryption whenever medical data is stored or processed in a cloud platform
- German legislation on professional disclosure requests for end-to-end encryption if data is transmitted through a cloud platform<sup>19</sup>

*Actors and Flow of Information*

The figure below sketches the actors and information flows as implemented with recent state-of-the-art diabetes treatment.

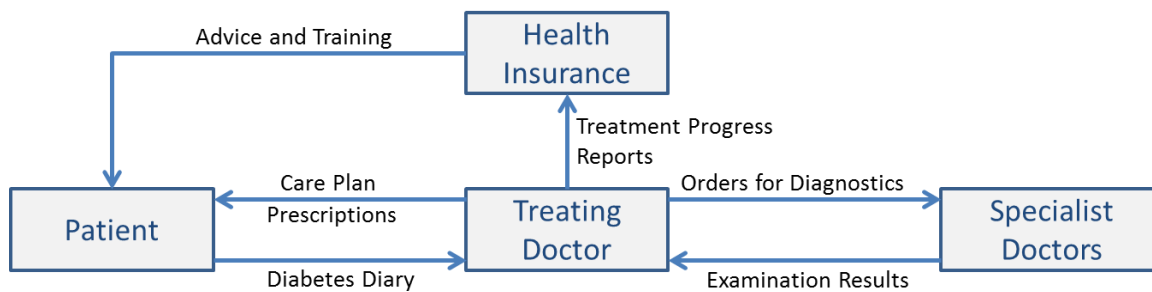

Figure 9: Actors and Flow of Information

<sup>17</sup> <https://www.emperra.com/bluetooth-insulin-pen--der-prototyp.html>

<sup>18</sup>

[http://www.elga.gv.at/fileadmin/user\\_upload/Dokumente\\_PDF\\_MP4/Recht/BGBLA\\_2012\\_I\\_111.pdf](http://www.elga.gv.at/fileadmin/user_upload/Dokumente_PDF_MP4/Recht/BGBLA_2012_I_111.pdf)

<sup>19</sup> Kompetenzzentrum Trusted Cloud: Leitfaden - Vertragsgestaltung beim Cloud Computing. März 2014. Online: [http://www.trusted-cloud.de/media/content/140317\\_Vertragsleitfaden\\_gesamt\\_RZ\\_Ansicht.pdf](http://www.trusted-cloud.de/media/content/140317_Vertragsleitfaden_gesamt_RZ_Ansicht.pdf)

As can be seen from the kind of information flowing between the actors, the whole care process is rather based on work sharing than on knowledge sharing; there is no piece of information which is shared among all actors, every actor just gets to know the minimum of information he needs to perform a specialized task:

- Patients provide information to their treating doctor through their diabetes diary.
- Based on defined schedules, the treating doctor requests specific diagnostics from specialists who respond with their examination results.
- From all this information the treating doctor assembles a care plan for the patient and progress reports for the patient’s health insurance.

In order to give an impression on the degree of IT-penetration in sharing this information, the following table summarizes which of the named documents are shared through which means in Germany. The recently most relevant means of data sharing is marked through a green shaded background.

Information Item	Transmission via Paper	Electronic Transmission
Diabetes Diary	Diary books are provided by all pharma companies as give-aways to doctors.	The market leading company MySugr has 500.000 downloads in the EU and the USA. This is ca. 1% of the diabetics in these regions.
Care Plan	Patients receive their care plans on paper. Due to missing dedicated forms in major hospital information systems, doctors usually even fill out paper forms.	-
Prescription	Doctors fill in prescription electronically and print them out in order to hand them over to the patient.	-
Orders	Doctors fill in orders electronically and print them out in order to hand them over to the patient.	Electronic orders only if the requested examination is performed within the same healthcare organization.
Examination Results	Forms and letters given to the patient on paper.	Electronic result transmission only if the requested examination is performed within the same healthcare organization.
Progress Reports	Paper forms available but rarely used.	All major IT-systems for doctors and hospitals provide electronic forms for assembling reports and sending them to the health insurance.
Training/Advice	Directed communication between health insurances and patients is solely on paper.	Generic web portals for specific disease groups.

Table 18: Overview of the German state of the art for sharing eHealth data

#### 4.2.4 Value Proposition

The CREDENTIAL eHealth use case will implement a Personal Health Record (PHR) for sharing information among all actors who are involved in the patient’s treatment. CREDENTIAL technologies

will be used to safeguard PHR data from unauthorized disclosure and to provide means to the patient to have full control over who may see which information.

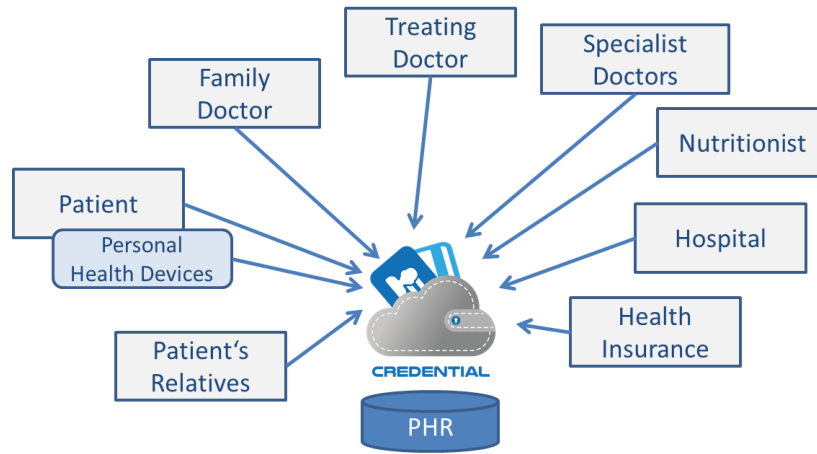

Figure 10: Information Sharing

By this we will push forward an information sharing paradigm instead of the very much reimbursement driven work sharing approach. This reflects joint responsibility for the patient’s health and is a prerequisite for any form of managed care where payers do not contract single care providers but regional care networks. The implicit benefits that come with this information sharing paradigm are:

- All data is shared electronically by the means of a PHR. By this there are no media breaks along the information chain.
- Access to information is not determined by workflow constraints but by information needs.
- Further actors (e. g. patients’ relatives, nutritionists and hospital emergency departments) can easily be integrated into the system and by this gain access to information as soon as they become part of the care team.

The table below breaks these general improvements down into concrete value propositions for the actors.

Actor / Stakeholder	Before	Benefit using CREDENTIAL
<b>Patient</b>	Has to go to the doctor in order to share his diabetes data	Sharing of diabetes data from anywhere at any time
	Relevant information often not available when needed most (e.g. emergency admission)	Information can easily be made accessible to any actor
<b>Treating Doctor</b>	Needs to actively request and collect relevant information	Available information can be seen at a glance. All actors can proactively provide new information.
	Same information needs to be re-assembled into different forms and documents for different actors	All actors may get access to the same set of documents.
<b>Specialist Doctors</b>	Forced to perform orders without having a full picture of the patient	Do not depend on other doctors with respect to the information they get
<b>Health Insurance</b>	Offers bonus programs for patient for patients.	Can receive progress information directly from patients in order to issue bonus program achievements.

Table 19:eHealth value proposition

## 4.2.5 Business Actors

### 4.2.5.1 Human Actors

**Patient** - The patient is the subject to services provided by one or more healthcare professionals. In the CREDENTIAL eHealth use case the patient is considered to suffer from diabetes and seeking help from health professionals to better cope with his disease and to prevent complications and comorbidities.

**Health Professional** – The term health professional (HP) denotes a doctor of medicine, a nurse responsible for general care, a dental practitioner, a midwife or a pharmacist within the meaning of Directive 2005/36/EC, or another professional exercising activities in the healthcare sector which are restricted to a regulated profession as defined in Article 3(1)(a) of Directive 2005/36/EC, or a person considered to be a health professional according to the legislation of the country of treatment. Health professionals are allowed to process medical patient data according to the legislation of the country of the health professional's residence. For the CREDENTIAL eHealth use case different professions of health professionals are considered:

- **Family Doctor** - The family doctor is the patient's primary care provider who takes responsibility for overseeing the whole medical history of the patient. In addition, the family doctor assembles and maintains common care documents such as medication plans and emergency data.
- **Diabetologist** - The diabetologist is a specialist doctor for treating diabetes patients. In the CREDENTIAL eHealth use case the diabetologist oversees all diabetes-related treatment and care activities. He creates and controls the patient's care plan and acts as the main contact for both the patient and the health insurance within the legal framing of the structured diabetes program.
- **Nutritionist** - In the CREDENTIAL eHealth business scenario the nutritionist gives advice to the patient with respect to a healthy and balanced diet. He assembles and maintains the patient's diet plan and tracks the adherence of the patient with that plan.
- **Other Specialist Doctors** - Other specialist doctors get involved in the patient's diabetes treatment for performing regular prevention examinations and in cases of complications or comorbidities. Typical examples of specialists involved in diabetes treatment are ophthalmologists, cardiologists and nephrologists.

### 4.2.5.2 System Actors

**Personal Health Record (PHR)** – The CREDENTIAL eHealth scenario utilizes a Personal Health Record (PHR) under the full control of the patient. The PHR is operated and hosted by a provider of the patient's choice. All respective contractual relationships are solely between the patient and his PHR provider. Health professionals may be authorized by the patient to read data from the PHR or to contribute data to the PHR. It is the responsibility of the patient as the owner of his PHR to assure that data is only disclosed from the PHR for the purposes it was originally collected and stored in the PHR.

**Clinical IT Systems** - Health Professionals interact with the patient's PHR through their clinical IT systems. In particular clinical IT systems (1) provide means for creating, editing and displaying medical documents, (2) provide all interfaces and workflows for sharing medical data through a PHR, (3) receive notifications about new data available from PHRs and (4) register alerts, validate alerts against new data and trigger defined activities. For CREDENTIAL two kinds of clinical IT systems are considered:

- **Practice Management Systems** – IT systems used by resident physicians for managing patient data and practice operations.
- **Hospital Information Systems** – IT systems used by hospitals which provide an electronic medical record (EMR), order-entry services and clinical workflow support services.

**Personal Health Device** - Personal Health Devices are devices which are used and operated by the patient. Using various kinds of sensors, personal health devices capture, process, visualize and/or transmit data about the patient's health, activity and/or lifestyle. For CREDENTIAL eHealth use case the following personal health devices will be considered:

- **Glucometer** – Personal health device for measuring a blood glucose level
- **Scale** - Personal health device for measuring a body weight
- **Blood Pressure Monitor** - Personal health device for measuring a blood pressure
- **Activity Tracker** - Personal health device for continuously measuring pulse, steps, skin resistance and other vital/activity data

**Application Hosting Device** - An application hosting device is a central point of control with the patient. It contains a number of client components that use the PAN, LAN, TAN and WAN interfaces to access one or more services on other devices to coordinate data collection, data analysis, data sharing and alerting. For CREDENTIAL the patient's **SmartPhone** will take the role of an Application Hosting Device.

#### 4.2.5.3 Legal Actors

**Healthcare Professional Organization of the Diabetologist** – In the CREDENTIAL eHealth use case the HPO of the diabetologist contracts with the patient's health insurance company on the implementation of a disease management program about diabetes prevention and treatment. By this the HPO of the diabetologist takes responsibility for an efficient flow of information among all actors.

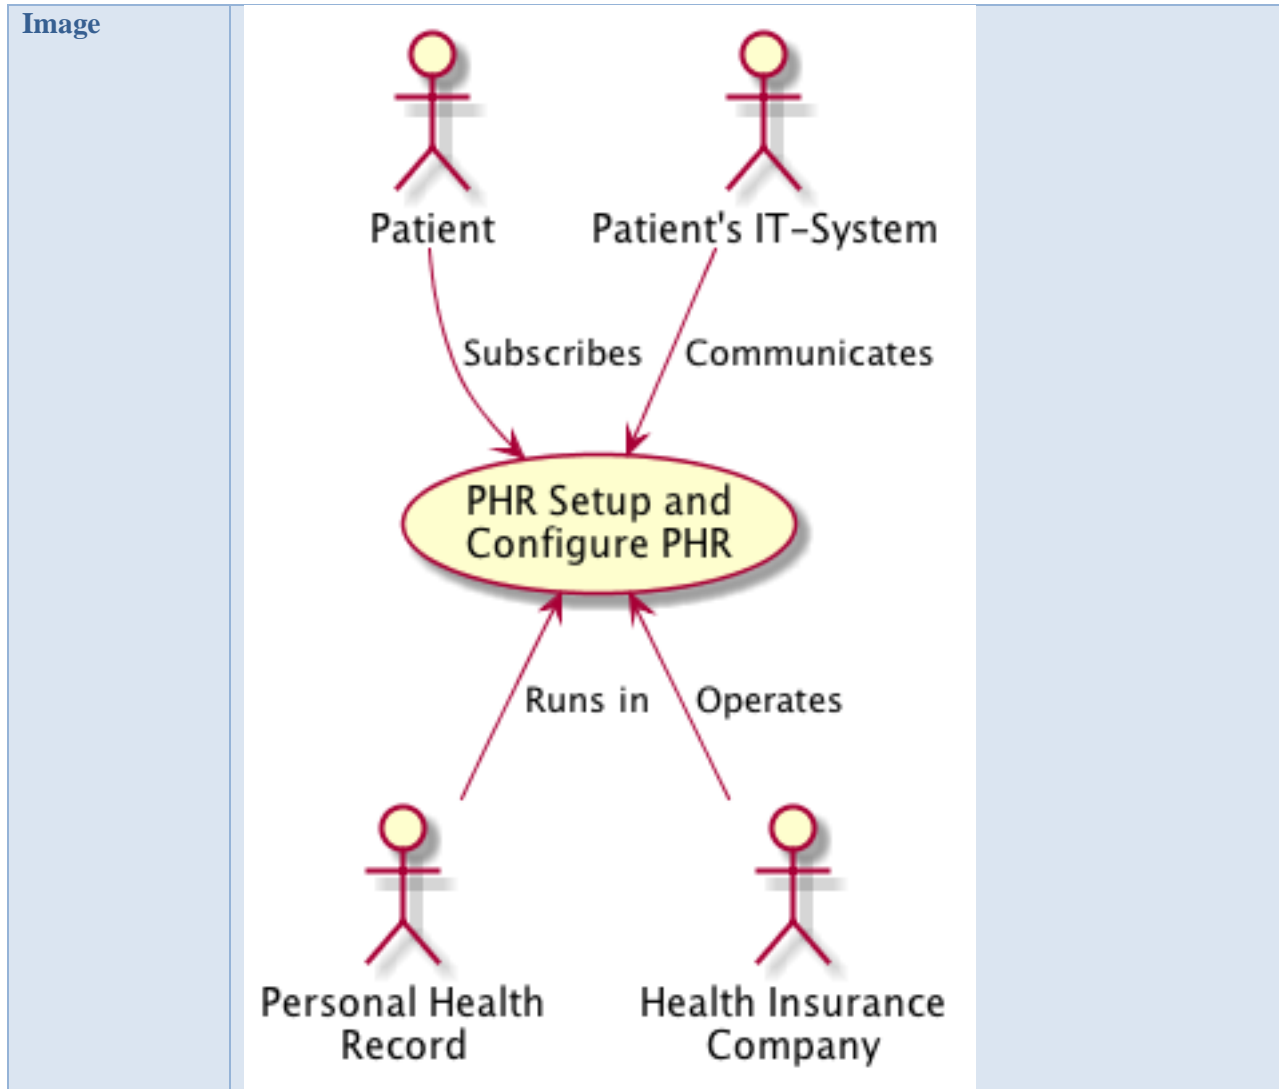

**Health Insurance Company** – The patient's health insurance company defines the framing conditions for the patient's treatment by setting up quality indicators and regulating the cooperation among the involved actors. In the CREDENTIAL eHealth use case the patient's health insurance company contracts with the HPO of the diabetologist on the implementation of a disease management program about diabetes prevention and treatment.

## 4.2.6 Storyboards

### 4.2.6.1 PHR Setup

<b>Story Name</b>	<b>PHR Setup</b>
<b>ID</b>	E-HEA-PHRSTUP
<b>Purpose</b>	The CREDENTIAL eHealth storyboard builds upon a Personal Health Record (PHR) as the primary means for sharing health data among the various actors. This story describes the setup of a PHR for a patient.
<b>Human Actor</b>	- Patient
<b>System Actors</b>	- Personal Health Record (for sharing data between patient and health professionals) - Application Hosting Devices (Smartphone for connecting to the PHR)
<b>Legal Actors</b>	-
<b>Pre-conditions</b>	The patient's statutory health insurance is operating a PHR platform. The insurer's customers may subscribe into using a private PHR instance for collecting and sharing their personal health data.
<b>Post-conditions</b>	A shared Personal Health record (PHR) has been set up for collecting and sharing medical data. The patient has signed the PHR provider's terms and conditions and is aware about how to use the various services the PHR platform offers. The patient's Smartphone is registered as a trusted device with the PHR.
<b>Scenario</b>	<p>While prescribing an antibiotic, a doctor asks Alice if she has known resistance against certain types of antibiotics. Alice remembers that there was something written about this in a doctors letter she received after a stay in hospital 2 years ago but can neither remember what this was about nor where she may have deposited a copy of that letter. The doctor tells Alice that Alice's health insurance is offering a Personal Health Record to its customers where doctors' letters and other medical documents can be stored electronically in order to be available when needed.</p> <p>Back at home Alice visits her health insurer's home page in the WWW and fills in an online form for requesting her Personal Health Record (PHR). Two hours later she receives an e-Mail from the health insurance saying that her PHR has been instantiated any may be activated through her electronic health insurance card. Additionally, she may download a free PHR App from an App Store which allows for managing the PHR and its contained document through a mobile device. Alice installs the PHR App on her Smartphone and steps through the PHR activation procedure. After a few clicks she has activated and personalized her PHR and registered her Smartphone as a trusted device for granting permissions to doctors and exchanging documents between the PHR and the Smartphone.</p>

#### 4.2.6.2 Care Planning and Progress Tracking

<b>Story Name</b>	<b>Care Planning and Progress Tracking</b>
<b>ID</b>	E-HEA-CAREPLANPROGTRAC
<b>Purpose</b>	This story covers the definition of therapy goals and continuous tracking of progress towards these goals. It is the baseline story for the CREDENTIAL eHealth proof-of-concept which covers the initialization of the covered care episode and continuously repeated activities.
<b>Human Actor</b>	<ul style="list-style-type: none"> <li>- Patient</li> <li>- Diabetologist</li> <li>- Family Doctor (optional)</li> </ul>
<b>System Actors</b>	<ul style="list-style-type: none"> <li>- Personal Health Record (for sharing data between patient and health professionals)</li> <li>- Personal Health Devices (for monitoring blood sugar, body weight and blood pressure)</li> <li>- Application Hosting Devices (Smartphone for connecting to the PHR)</li> </ul>
<b>Legal Actors</b>	<ul style="list-style-type: none"> <li>- HPO of the Diabetologist (as DPP contractual partner)</li> <li>- Statutory Health Insurance (as DPP contractual partner)</li> </ul>
<b>Pre-conditions</b>	<ul style="list-style-type: none"> <li>- A shared Personal Health record (PHR) has been set up for collecting and sharing medical data in accordance with the patient's consent</li> <li>- The patient is equipped with a personal hub device (e.g. a SmartPhone) that forwards all data collected by the patient to the PHR and receives data from the PHR</li> <li>- All human actors are technically enabled to interact with the PHR through their existing IT systems (patient: SmartPhone; Diabetologist: clinical IT system)</li> <li>- All human actors have been advised and trained in interacting with the PHR</li> </ul>
<b>Post-conditions</b>	The formal framing has been set up and all actors are enabled to share treatment relevant data securely via a PHR. Care goals have been defined and the diabetologist has all data available to continuously track the patient's progress in reaching the care goals.
<b>Scenario</b>	<p>Alice is suffering from hypertension for several years and is showing symptoms of Diabetes type-2. For patients like Alice her health insurance company offers a dedicated Diabetes Prevention Program (DPP) where a diabetologist supports patients to change their lifestyle and to prevent follow-up diseases. This program is highly standardized and builds upon a PHR as a core tool for collecting and assessing treatment related data. While she is actively participating in the program, Alice receives all required devices for home monitoring from the diabetologist.</p> <p>At the first visit with the diabetologist, the diabetologist collects core vital data (height, weight, blood pressure, HbA1c, blood sugar) from Alice and informs her about her recent situation and further diseases which may show up in case that one will not be able to control her diabetes at a reasonable level. For this the Diabetologist defines as a care goal that Alice shall reduce her Body Mass Index from 34 kg/m<sup>2</sup> to 25 kg/m<sup>2</sup>, shall stay with a HbA1c of 7.4 mmol/mol max, and request help from her family doctor to reduce her recent systolic blood pressure of 170 mmHg to 130 mmHg max.</p> <p>Alice signs a consent which grants permissions to the diabetologist and Alice's family doctor that allow them full access to her PHR. Through her smartphone she registers respective access rights to these doctors with her PHR. The diabetologist assembles several documents from the data gathered so far and uploads them to the PHR. Among these are:</p> <p>* (initial) health status summary</p>

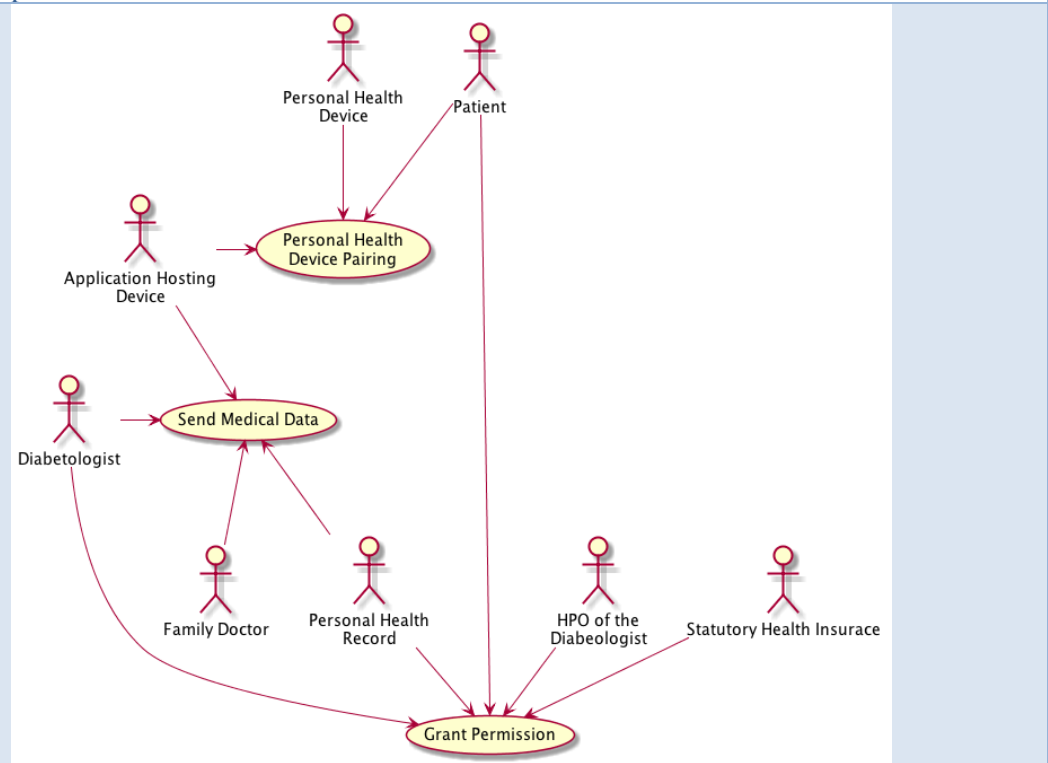

\* definition of care goals  
 \* documentation of the given consent

The diabetologist hands over to Alice a glucometer and advises her how and when to measure her blood sugar level at home. In addition he gives her a digital scale and a blood pressure monitor which she shall use for measuring her weight and blood pressure every morning and evening. All devices have integrated Bluetooth connectivity for sending measured data to a SmartPhone. Together Alice and the Diabetologist install and configure the required \_Apps\_ on Alice's SmartPhone which not only allows Alice to see the measured data for her own in a patient friendly manner but even utilizes connectivity services of the SmartPhone for uploading the measured data to the PHR so that the Diabetologist has these immediately available when needed.

The Diabetes Prevention Program foresees that Alice will visit her diabetologist every 3 months. At these visits he will measure the HBA1c blood sugar amount (long time blood sugar), as well as the LDL (Low Density Lipoprotein) and the creatinine which is an important indicator of renal health. The diabetologist will add these lab reports to Alice's PHR. Alice will be notified about this by receiving a message on her mobile phone.

**Image**

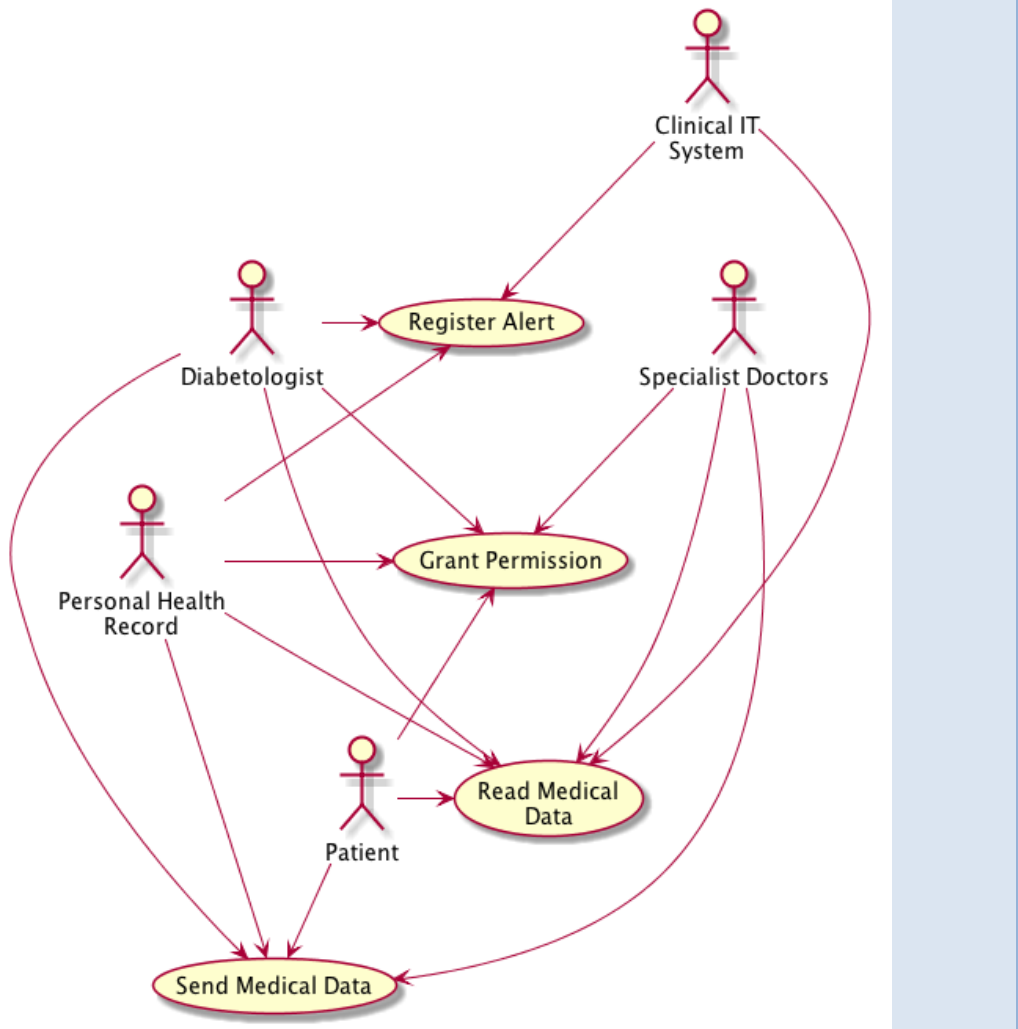

### 4.2.6.3 Therapy Monitoring and Screening for Complications

<b>Story Name</b>	<b>Therapy Monitoring and Screening for Complications</b>
<b>ID</b>	E-HEA-S-THERMONSCREENCOMPL
<b>Purpose</b>	This storyboard collects all processes the Diabetologist may perform on the patient's PHR for best monitoring the therapy and involving other actors into the treatment process.
<b>Human Actor</b>	<ul style="list-style-type: none"> <li>- Patient</li> <li>- Diabetologist</li> <li>- Specialist Doctors (resident or at a hospital)</li> </ul>
<b>System Actors</b>	<ul style="list-style-type: none"> <li>- Personal Health Record (for sharing data among health professionals and with the patient)</li> <li>- Clinical IT System (for analyzing data and assembling reports)</li> </ul>
<b>Legal Actors</b>	<ul style="list-style-type: none"> <li>- HPO of the diabetologist (as DPP contractual partner)</li> <li>- Statuary health insurance company (as DPP contractual partner)</li> </ul>
<b>Pre-conditions</b>	<ul style="list-style-type: none"> <li>- The patient has given consent to sharing her medical data using an PHR and granted to her diabetologist and family doctor all required permissions</li> <li>- Care goals have been defined and the patient provides all data that is needed for tracking the progress towards these goals to her PHR</li> </ul>
<b>Post-conditions</b>	<ul style="list-style-type: none"> <li>- Thresholds have been defined and registered for supporting a fine grained monitoring of the patient's performance and compliance.</li> <li>- Relevant specialists use the PHR for sharing treatment related (diagnostic) data with the patient and her diabetologist. Required permissions are granted.</li> </ul>
<b>Scenario</b>	<p>The Diabetes Prevention Program requests the Diabetologist to assess Alice's daily measured data at least once per month and to provide feedback to Alice about any change in treatment or life style. To support the Diabetologist in this, daily and quarterly measured data and various statistics can be visualized and correlated in various ways through the Diabetologist's IT system. Selected annotated reports and diagrams may be stored in the PHR for better informing and involving Alice and her family doctor.</p> <p>In order to better catch critical situations the diabetologist may register thresholds on defined aggregated data within his clinical IT system. In case a threshold is met, an alarm notice is sent to the diabetologist. The diabetologist assesses the situation and decides on whether a modification of the care plan is required or if a phone call with the patient may be sufficient. In Alice's case the diabetologist registers thresholds for getting notified, if there is no decrease in body weight within the last 10 days and if Alice has not provided certain monitoring data for more than 3 days. The diabetologist takes responsibility for scheduling regular visits to other specialists. The Diabetes Prevention Program requests for such referrals for annual screening of eyes, feet and kidney by respective specialists. In advance to these visits the diabetologist assembles relevant data into a short report that is stored in the patient's PHR. The patient may grant a specialist access to this data by giving respective permissions. Again specialists may use the means of the PHR to transmit diagnostic reports back to the patient, her family doctor and her diabetologist. The same procedures apply in cases where the patient needs to be referred to hospital.</p>

Image

#### 4.2.6.4 Nutrition and Activity

<b>Story Name</b>	<b>Nutrition and Activity</b>
<b>ID</b>	E-HEA-S-NUTRACTI
<b>Purpose</b>	This storyboard reflects the core processes of diabetes therapy stage 1 (Nutrition and Activity).
<b>Human Actor</b>	<ul style="list-style-type: none"> <li>- Patient</li> <li>- Diabetologist</li> <li>- Nutritionist</li> </ul>
<b>System Actors</b>	<ul style="list-style-type: none"> <li>- Medical Health Devices</li> <li>- Personal Health Record</li> </ul>
<b>Legal Actors</b>	<ul style="list-style-type: none"> <li>- HPO of the diabetologist (as DPP contractual partner)</li> <li>- Statuary health insurance company (as DPP contractual partner)</li> </ul>
<b>Pre-conditions</b>	<ul style="list-style-type: none"> <li>- The patient has given consent to sharing her medical data using an PHR and granted to her diabetologist and other involved doctors all required permissions</li> <li>- Care goals have been defined and the patient provides all data that is needed for tracking the progress towards these goals to her PHR</li> </ul>
<b>Post-conditions</b>	<ul style="list-style-type: none"> <li>- Further vital data is monitored, stored and assessed.</li> <li>- A nutritionist is involved in the treatment and is granted all permissions for accessing nutrition and activity related data within the PHR.</li> </ul>
<b>Scenario</b>	<p>Even though Alice performed some slight changes in her lifestyle, her BMI is still at 34 kg/m2 after 4 weeks within the Diabetes Prevention Program. She requests for a visit with the diabetologist. The diabetologist is familiar with such cases and therefore brings his assistant who is a diet specialist to the meeting. During the meeting it becomes obvious the Alice has no idea about how much she moves a day and how much calories and fat certain of her common meals have. For increasing her awareness and allowing her for a better self-monitoring the diet specialist gives an activity belt to Alice which allows her to record the number of steps she takes a day. Like the other devices, the belt is linked with the SmartPhone and configured that initially only aggregated weekly data is disclosed to the diabetologist through the PHR. As an additional care goal Alice and the diabetologist agree that she will take 50.000 steps per week initially.</p> <p>For optimizing her diet, Alice agrees that she will record all food intake of the next week and provide the list to the diet specialist via the PHR. The diet specialist will assess her eating habits and give recommendation on how this can be optimized towards a more balanced diet. For better tracking this, the diet specialist recommends Alice to run a Nutrition App on her SmartPhone that supports her in counting calories. Alice agrees to disclose this information to the diabetologist.</p> <p>For better informing Alice on her performance and progress the newly gathered data on activity and nutrition will be correlated to the other monitoring data and an automatically rendered report will be placed in the PHR every week.</p>
<b>Image</b>	<pre> graph TD     MD[Medical Health Device]     PHR[Personal Health Record]     D[Diabetologist]     N[Nutritionist]     P[Patient]      MD --&gt; SM[Send Medical Data]     PHR --&gt; SM     PHR --&gt; RM[Read Medical Data]     D --&gt; RM     N --&gt; RM      P --&gt; PDP[Personal Health Device Pairing]     P --&gt; GP[Grant Permission]     MD --&gt; PDP     MD --&gt; GP     PHR --&gt; GP      SM --&gt; RM     </pre>

### 4.2.6.5 Oral Medication

<b>Story Name</b>	<b>Oral Medication</b>
<b>ID</b>	E-HEA-S-ORALMED
<b>Purpose</b>	This storyboard reflects the core processes of diabetes therapy stage 2 (Oral Medication).
<b>Human Actor</b>	<ul style="list-style-type: none"> <li>- Patient</li> <li>- Diabetologist</li> </ul>
<b>System Actors</b>	<ul style="list-style-type: none"> <li>- Medical Health Devices</li> <li>- Personal Health Record</li> </ul>
<b>Legal Actors</b>	<ul style="list-style-type: none"> <li>- HPO of the diabetologist (as DPP contractual partner)</li> <li>- Statuary health insurance company (as DPP contractual partner)</li> </ul>
<b>Pre-conditions</b>	<ul style="list-style-type: none"> <li>- The patient has given consent to sharing her medical data using an PHR and granted to her diabetologist and other involved doctors all required permissions</li> <li>- Care goals have been defined and the patient provides all data that is needed for tracking the progress towards these goals to her PHR</li> </ul>
<b>Post-conditions</b>	<ul style="list-style-type: none"> <li>- A medication plan is assembled and shared through the PHR.</li> </ul>
<b>Scenario</b>	<p>Even though Alice's BMI is getting lower, her HbA1C is still above 8 and consequently her daily blood sugar is rarely below 130. In order to complement the ongoing changes in lifestyle and nutrition, the diabetologist prescribes Metformin to Alice.</p> <p>Because Alice is also taking other pills prescribed by her family doctor and other specialists, the diabetologist recommends her to ask her family doctor for a medication plan that not only lists all required medication but even gives advice on how and when to take the different pills. The medication plan will be stored electronically in the PHR and as such is accessible to all doctors who are involved in Alice's diabetes treatment.</p>
<b>Image</b>	<pre> graph TD     Patient((Patient)) -- Grant Permission --&gt; PHR((Personal Health Record))     PHR -- Send Medical Data --&gt; Patient     Diabetologist((Diabetologist)) -- Read Medical Data --&gt; PHR     PHR -- Send Medical Data --&gt; Diabetologist     </pre>

### 4.2.6.6 Insulin Therapy

<b>Story Name</b>	<b>Insulin Therapy</b>
<b>ID</b>	E-HEA-S-INSTHERPY
<b>Purpose</b>	This storyboard reflects the core processes of diabetes therapy stage 3 (Insulin Therapy).
<b>Human Actor</b>	<ul style="list-style-type: none"> <li>- Patient</li> <li>- Diabetologist</li> </ul>
<b>System Actors</b>	<ul style="list-style-type: none"> <li>- Personal Health Record</li> </ul>
<b>Legal Actors</b>	<ul style="list-style-type: none"> <li>- HPO of the diabetologist (as DPP contractual partner)</li> <li>- Statuary health insurance company (as DPP contractual partner)</li> </ul>
<b>Pre-conditions</b>	<ul style="list-style-type: none"> <li>- The patient has given consent to sharing her medical data using an PHR and granted to her diabetologist and other involved doctors all required permissions</li> <li>- Care goals have been defined and the patient provides all data that is needed for tracking the progress towards these goals to her PHR</li> </ul>
<b>Post-conditions</b>	<ul style="list-style-type: none"> <li>- All plans are updated to reflect the changes that come with intensivation of the therapy.</li> </ul>
<b>Scenario</b>	<p>During the last months Alice suffered from two hyperglycemia which leads her diabetologist to the decision that she needs to inject insulin for stabilizing her blood sugar level. His assistant gives Alice advice and training in how to inject insulin at home. The diabetologist assembles a care plan that shows when she needs to inject how many units of insulin. Additionally</p> <ul style="list-style-type: none"> <li>- the medication plan is updated to include the insulin that is prescribed to Alice,</li> <li>- the frequency of blood sugar measurements is adapted so that Alice now needs to measure her blood sugar 30 minutes before every meal, 2 hours after every meal and 1 hour before going to bed.</li> </ul> <p>The adapted plans are stored in the PHR.</p>
<b>Image</b>	<pre> graph TD     Patient((Patient)) --&gt; Send([Send Medical Data])     PHR((Personal Health Record)) --&gt; Send     Send --&gt; Diabetologist((Diabetologist))     PHR --&gt; Read([Read Medical Data])     Diabetologist --&gt; Read     </pre>

### 4.2.7 Business Use Cases

The six eHealth storyboards are described specifically in 8 BUCs, which are formally defined in the Appendix. The following table provides an overview:

Use Case Name	Unique ID	Main Actor
<b>Setup and Configure PHR</b>	E-HEA-BUC-SETUPCONFPHR	Personal Health Record (PHR)
<b>Grant Permission</b>	E-HEA-BUC-GRANDPERM	Personal Health Record (PHR)
<b>Revoke Permission</b>	E-HEA-BUC-REVOKEPERM	Personal Health Record (PHR)
<b>Send (Medical) Data</b>	E-HEA-BUC-SENDMEDDATA	Personal Health Record (PHR)
<b>Read (Medical) Data</b>	E-HEA-BUC-READMEDDATA	Personal Health Record (PHR)
<b>Personal Health Device Pairing</b>	E-HEA-BUC-PERSHEALTHDEVPAIR	Patient’s IT-System
<b>Register Alert</b>	E-HEA-BUC-REGALERT	Clinical IT System
<b>View Permissions</b>	E-HEA-BUC-VIEWPERM	Personal Health Record (PHR)

Table 20: eHealth specific BUCs

Note here that, in order to reduce the number of domain specific BUCs, “Register Alert” also covers the deletion or modification of existing alerts. This is made explicit in the formal specification of the BUC in Appendix 1A.3.2.

The following table now show which of the above BUCs are associated with which of the eHealth story boards defined before:

	PHR Setup	Care Planning and Progress Tracking	Therapy Monitoring and Screening for Complications	Nutrition and Activity	Oral Medication	Insulin Therapy
<b>Setup and Configure PHR</b>	✓					
<b>Grant Permission</b>		✓	✓	✓	✓	
<b>Revoke Permission</b>		■	■	■	■	
<b>Send (Medical) Data</b>		✓	✓	✓	✓	✓
<b>Read (Medical) Data</b>			✓	✓	✓	✓
<b>Personal Health Device Pairing</b>		✓		✓		
<b>Register Alert</b>			✓			
<b>View Permissions</b>		■	■	■	■	

Table 21: Relation of BUCs and story boards in the eHealth pilot

We note that two of the BUCs, namely “Revoke Permission” and “View Permissions” are not covered by any of the story boards. This is because of our top-down approach, where we first started defining the story boards, reflecting typical goals a user wants to achieve when using our system. The uncovered BUCs were then inferred by considering less frequent yet inherently needed interactions. For instance, changing one’s diabetologist and thus revoking the access rights of the previous doctor is not a very frequent action, and therefore it is not covered in the story boards. However, it is obvious that such a step needs to be supported by the system. BUCs that are not directly covered by a story board but might still be relevant in their context are indicated with grey boxes.

## 4.3 eBusiness

In eBusiness environment, there are different opportunities given by CREDENTIAL technologies to make user authentication safer and easier, service subscription faster and data sharing really secure. In fact, the aim of eBusiness pilot is to demonstrate how users can leverage on CREDENTIAL Wallet and which is the value added. To achieve this goal, we focused on setting and evaluating different use cases in which CREDENTIAL is used “as a service” or integrating specific components (e.g. re-encryption libraries).

### *Use CREDENTIAL for Identity federation*

Users access a lot of websites and online services every day: for each one of these they have to login into the website, often with username and password, sometimes, for some service such as bank account, with username, password and an OTP (one-time-password). This means that users must remember dozens of passwords. For this reason, many websites and applications allow the registration with existing users’ social media account (e.g. Facebook). But this could not be the solution for such online services that deal with “certified” account, based on a contract and user recognition. In this Scenario CREDENTIAL would be the perfect tool to realize a “trusted Identity Federation”.

### *Use CREDENTIAL for empower trust in legal communication*

Thanks to the technology of proxy re-encryption, within CREDENTIAL project will be possible to test the sharing of information and data with other users in a trusted way. In eBusiness Pilot, InfoCert Registered e-mail service, Legalmail, could be the application in which integrate the re-encryption technology to demonstrate how more security in sharing legal communications do not affect usability and allow confidentiality within users.

### *Use CREDENTIAL as a Digital Wallet to import data*

Part of CREDENTIAL project consist in develop a digital secure wallet in which users can store their personal information and sensitive data with the assurance of a high level of privacy guaranteed but with also the flexibility to securely share those data. Saving his data within the wallet, User has the opportunity to use CREDENTIAL service to fulfill forms online and subscribe contracts wherever he is, with all information needed available at any time.

### *Use CREDENTIAL to store Digital Signature PIN to protect and simplify signature experience*

Digital Signature is becoming one of the most important key-points in the digitalization era for the impact it might have in allowing the transactions’ dematerialization. Thanks to digital signature, users and organizations can digitally sign documents with the legal evidence of integrity and authenticity of transaction. To use a digital signature certificate based on PKI (*Public Key Infrastructure*) system, user must authenticate himself entering his PIN and confirm the transaction. Thanks to CREDENTIAL he could store this sensitive information within the wallet and authenticate himself with credential to disclose the PIN at the moment of transaction.

### *Use CREDENTIAL to store and share private data*

CREDENTIAL project provides a high level of privacy guaranteed on the user’s sensitive data and a secure way to share with other CREDENTIAL users. Several business use cases exploit the

CREDENTIAL technology of proxy re-encryption to share user private information in a trusted way. In eBusiness Pilot, CREDENTIAL users could be able to afford access to private data integrate the re-encryption technology in secure communications.

### 4.3.1 Stakeholders

Although in the eBusiness IAM domain there could be involved potentially everyone, in a service provider – service user (customer) relationship, the eBusiness domain focuses in the B2B and B2C relationships and service offerings. With that in mind there are some distinct roles identified according to their perspective and impact on the management, operation and use of an IAM system.

- Process owners (or Business owners) are responsible for interacting with corporate systems or applications in order to manage identities from a functional and procedural perspective. These individuals often do not interact with the systems or applications from a technical operations perspective, but are rather end users from a business process perspective.
- System/Application owners are responsible for maintaining various systems or applications from a technical perspective. These individuals may leverage an application-specific administrative interface in order to maintain user accounts.
- Data owners are responsible for managing identity data within a given environment - major identity data repositories. They are usually database administrators and directory administrators with an in-depth understanding of the size and flow of data in the infrastructure. Data owners should be knowledgeable of any online or offline synchronization activities that occur between repositories, as well as data transfer methods that are employed.
- An executive sponsor is an individual (or set of individuals) who has the authority to make relevant decisions and changes regarding existing processes that manage identity data in the organization.
- End users, who are the ones who are using the system, to get the service they need or want.

The above categorization does not exclude stakeholders to have more than one role, often depending on the size of an organization. Where, the larger the organization the higher the possibility that a stakeholder may have a distinct role, while in smaller organizations a stakeholder is likely to have more than one role. Finally, in the case of end users, when being the customers, they may probably be the data owners as well.

### 4.3.2 State of Art

In the current state, with respect to all the services mentioned above, the user communicates directly with the systems within the InfoCert domain, which in this case does not offer the opportunity to simplify their experience leveraging on other authentication system or cloud wallet to share information already stored in digital form, ext.

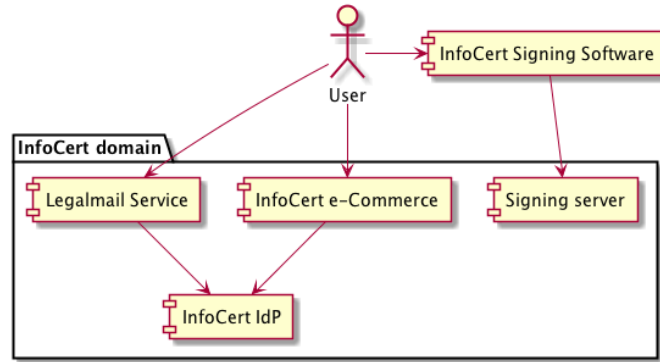

Figure 11: InfoCert State of the Art

Looking in detail the single use cases, the following functional diagrams are showing the actual user experience.

*Legalmail login*

In the first scenario, User is a legalmail active customer, so he possesses a personal account with which simply log in every time he needs to access in his personal mailbox.

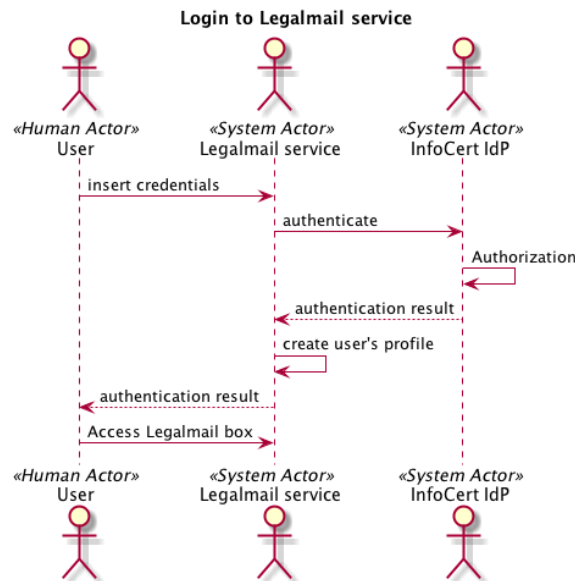

Figure 12: Login to Legalmail

*E-Commerce subscription*

Today, an e-commerce client has to fulfill a web-form to complete his subscription, sign the contract and send it back to InfoCert. All these operations are now completed manually for each service he wants to activate.

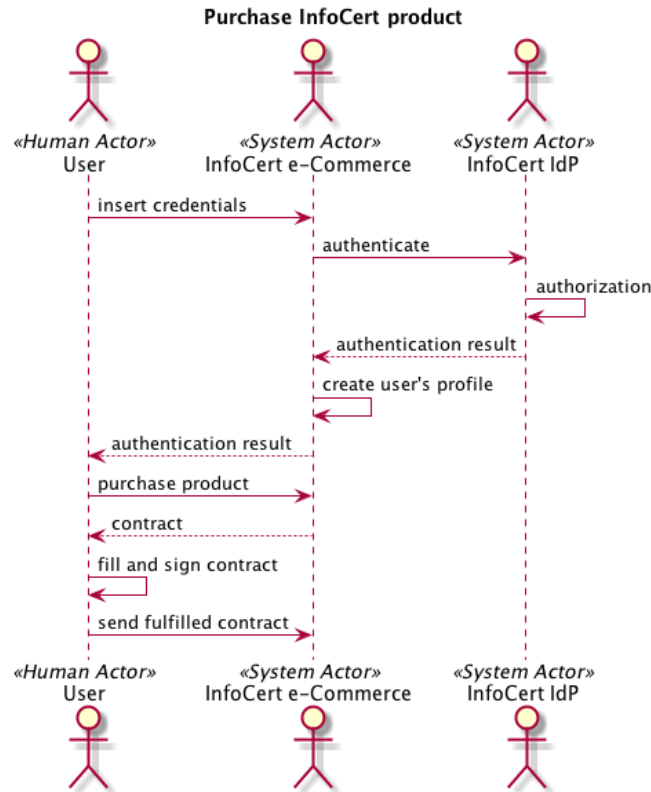

Figure 13: Purchase a InfoCert product

*Digital Signature experience.*

A user who possesses an InfoCert Digital Signature Certificate, today must remember different credentials:

- User id of remote signature account
- Password of remote signature account
- PIN of signature, that is used every time he wants to digitally subscribe a document
- OTP via SMS or App, to confirm his identity in signing

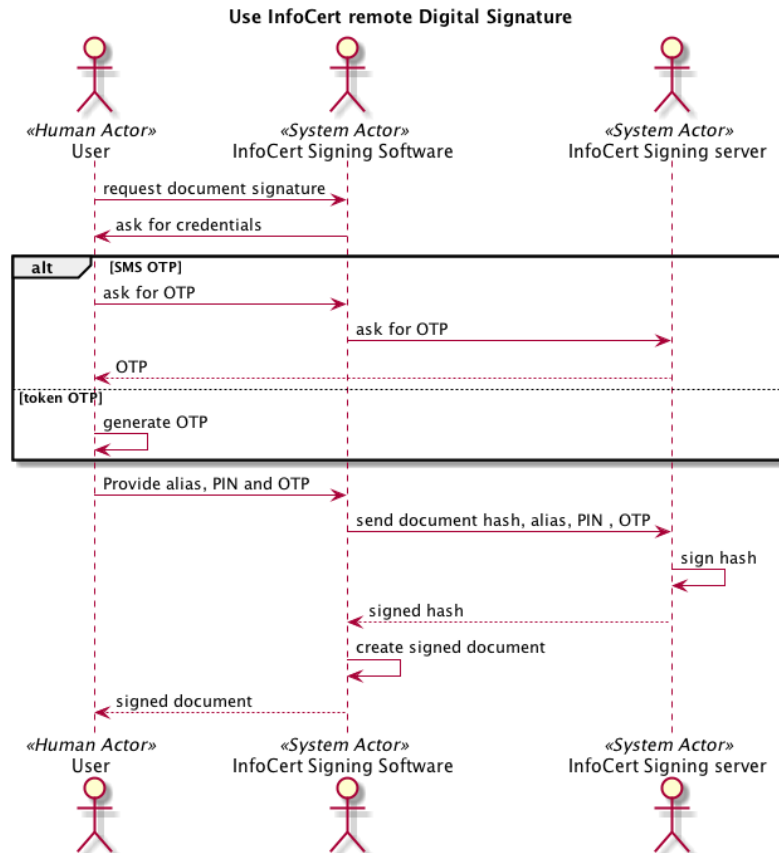

Figure 14: Remote Signature using InfoCert services

### 4.3.3 Value Proposition

As described above, in eBusiness what we want to show is how CREDENTIAL can make digital life of users safer, by protecting their sensitive information, whether these data are represented by login credentials or personal information. Not only, the aim is also to provide tools that, through a simple user experience, could give the opportunity to share personal information without compromising security of data.

For this reason, all use cases under evaluation have been proposed in order to achieve this dual objective of security and simplicity:

- a) In the case of the Identity Federation, user who has a credential account can easily access to a service like Legalmail without having to remember many, too many credentials, but with a big level of security offered by the system.
- b) In the case of proxy re-encryption, Legalmail user can forward an important mail to a trusted user, protecting the message itself.

- c) In the case of subscription within the e-commerce, there are several advantages: in fact, customers can tap into the information stored in the wallet by having them all at hand and share them securely with the application.
- d) In the latter case, the user stores in CREDENTIAL a very important piece of information: the PIN for the digital signature with which he gives legal value to digital transaction.

Actor / Stakeholder	Before	Benefit using CREDENTIAL
Legalmail User	Has to manage many credentials and many passwords	Thanks to CREDENTIAL he can login with different services using same credentials.
Legalmail User	Cannot encrypt important message before sending.	Messages containing sensitive data are being shared with a trusted user.
InfoCert Customer	Has to have all the information needed to subscribe contract available and has to fulfill manually each label	Importing data from wallet, he has all data always available and the fulfilling is automatic
Digital Signature User	For each signature has to remember and clearly disclose his signature PIN	Using CREDENTIAL, user experience is easier and transactions more secure, thanks to the re-encryption service.

Table 22: eBusiness Stakeholders

### 4.3.4 Business Actors

#### 4.3.4.1 Human Actors

**InfoCert Customer:** someone who activate one of the InfoCert subscription services. In the different use cases considered, an InfoCert Customer is a user that requires a Legalmail account or a Digital Signature user.

**Legalmail User:** Someone who possesses a Legalmail account.

#### 4.3.4.2 System Actors

**CREDENTIAL Wallet** – The Wallet

**InfoCert E-commerce** - the web portal on which users subscribe InfoCert services online

**Legalmail Service** - is the InfoCert registered e-mail service, a communication system similar to standard e-mail with some extra security features and certification of delivery that make messages enforceable against third parties. The PEC Legalmail makes it possible to send / receive text messages and attachments with the same legal validity as a registered letter with acknowledgment of receipt.

**InfoCert Dike** - is the software for digital signature, thanks to which it is possible to digitally sign documents and files using digital qualified certificates and verify validity of signatures and certificates.

**InfoCert Remote-sign service** - is the cloud service through which Digital Certificate of users are stored on tamperproof devices kept in secure vaults in the InfoCert premises (Hardware Security Module, or HSM).

**CREDENTIAL re-encryption libraries** – The CREDENTIAL libraries which enabled proxy-re-encryption functionality.

#### 4.3.4.3 Legal Actors

- InfoCert Operating Manual of registered e-mail service
- InfoCert Operating Manual of Remote Digital Signature

### 4.3.5 Storyboards

#### 4.3.5.1 Set up login to Legalmail by using CREDENTIAL

<b>Story Name</b>	<b>Set up login to Legalmail by using CREDENTIAL</b>
<b>ID</b>	E-BUS-S-SETUPLMAIL
<b>Purpose</b>	Login to Legalmail account using a CREDENTIAL account (it demonstrates the identity and access management functionalities)
<b>Human Actor</b>	Legalmail User
<b>System Actors</b>	<ul style="list-style-type: none"> <li>Legalmail service (that manages users electronic mail boxes)</li> <li>CREDENTIAL Identity Provider</li> </ul>
<b>Legal Actors</b>	InfoCert operating manual of the registered e-mail service, clause 4.11
<b>Pre-conditions</b>	<ul style="list-style-type: none"> <li>CREDENTIAL Identity Provider satisfies what stated in clause 4.11 of InfoCert operating manual of the registered e-mail service</li> <li>User has a Legalmail account</li> <li>User has a CREDENTIAL account</li> </ul>
<b>Post-conditions</b>	
<b>Scenario</b>	<p>Andrea is an architect and works for a multinational company. He leads different projects and often sends and exchanges information with various entities via internet. For this reason, he has chosen CREDENTIAL Wallet to protect his sensitive data and to authenticate in internet. In Italy he uses Legalmail as a communication system to send and receive official mail to/from customers, suppliers, etc.</p> <p>One day, logging in Legalmail, he discovers that InfoCert, as a service provider, accepts the ID Federation with CREDENTIAL: so he decides to federate his two accounts to</p> <p>be safer by storing his Legalmail account information within CREDENTIAL Wallet.</p> <p>So he authenticates to CREDENTIAL (i.e. entering username and password), that return to Legalmail service a signed assertion confirming the successful authentication as shown in the illustrations below. Legalmail associates the CREDENTIAL ID to the Legalmail account. Since that moment, Andrea will be able to use CREDENTIAL to authenticate to Legalmail as shown in the illustrations below. InfoCert, on its side, will accept every authentication method used by CREDENTIAL.</p>
<b>Image</b>	<pre> graph TD     User((Legalmail User)) --&gt; UC1((Using CREDENTIAL ID to login to InfoCert Legalmail))     UC1 --&gt; CIP((CREDENTIAL Identity Provider))     CIP --&gt; UC2((Account association between Legalmail and CREDENTIAL))     UC2 --&gt; LS((Legalmail Service))     </pre>

### 4.3.5.2 Activate encrypted Legalmail forward

<b>Story Name</b>	<b>Activate encrypted Legalmail forward</b>
<b>ID</b>	E-BUS-2-LMAIL
<b>Purpose</b>	Messages containing sensitive data are being shared with a trusted users
<b>Human Actor</b>	Legalmail_User
<b>System Actors</b>	<ul style="list-style-type: none"> <li>• Legalmail service (that manages users electronic mail boxes)</li> <li>• CREDENTIAL re-encryption libraries</li> </ul>
<b>Legal Actors</b>	InfoCert operating manual of the registered e-mail service, clause 4.11
<b>Pre-conditions</b>	<ul style="list-style-type: none"> <li>• Users have an encryption service configured in their Legalmail account</li> <li>• Users are sending registered mails with legalmail client software</li> </ul>
<b>Post-conditions</b>	<ul style="list-style-type: none"> <li>• A trusted user was able to read encrypted message received in my mailbox and forwarded to him</li> </ul>
<b>Scenario</b>	<p>Bob is sharing sensitive contents regarding business strategies with a partner, Alice. To share their data, Bob and Alice are using encrypted Legalmail service, sending registered emails with the legalmail clients. Just before an important deadline, Bob have some problems that prevents him from frequently checking his legalmail inbox and be up to date with the strategy evolutions. He therefore wants Charlie, a trusted colleague, to check for him the messages sent by Alice, but he doesn't want to give away the password of his legalmail.</p> <p>Bob activates a forward rule, forwarding to Charlie all the messages received by Alice and asking Charlie to warn him for any urgency.</p>
<b>Image</b>	<pre> graph TD     User((Legalmail User)) --&gt; UC(Activating message forward for encrypted Legalmail)     Service[Legalmail Service] --&gt; UC     Libraries[CREDENTIAL re-encryption libraries] --&gt; UC     </pre>

### 4.3.5.3 Import data into Legalmail subscription form. Choose CREDENTIAL for authentication

<b>Story Name</b>	Import data into Legalmail subscription form. Choose CREDENTIAL for authentication
<b>ID</b>	E-BUS-3-SHOP
<b>Purpose</b>	Purchase Legalmail service. Fulfill the subscription form by importing data from the CREDENTIAL Wallet. Associate the newly created Legalmail account to CREDENTIAL ID.
<b>Human Actor</b>	InfoCert Customer
<b>System Actors</b>	<ul style="list-style-type: none"> <li>• CREDENTIAL Wallet</li> <li>• InfoCert e-commerce site</li> </ul>
<b>Legal Actors</b>	<ul style="list-style-type: none"> <li>• InfoCert Subscription form</li> <li>• Legalmail contract</li> </ul>
<b>Pre-conditions</b>	<ul style="list-style-type: none"> <li>• Customer has a CREDENTIAL account and has the needed data stored in the CREDENTIAL Wallet</li> </ul>
<b>Post-conditions</b>	The subscription form is filled with the data from the CREDENTIAL Wallet. The customer will use only CREDENTIAL account to access InfoCert LegalMail service.
<b>Scenario</b>	Laura is the administrative responsible in a small company which is supplier of local public administrations. She is looking for an electronic Registered e-mail service to manage the billing cycle between her company and its customers. She discovers the e-commerce solution from InfoCert and decides to purchase the Legalmail service. Once she has chosen to purchase the service, she needs to fill a web form with her data and her company's data to be able to register to InfoCert e-commerce site and to sign the service's contract. She has a CREDENTIAL account and InfoCert is a Service Provider in the CREDENTIAL network. So she can fill the forms by sharing safely the needed data directly from CREDENTIAL Wallet without any risk. After completing the purchasing, she will be able to login to InfoCert Legalmail by using her CREDENTIAL account.
<b>Image</b>	

**4.3.5.4 Signing a document by using a remote digital signature credential stored in a HSM**

<b>Story Name</b>	Signing a document by using a remote digital signature credential stored in a HSM
<b>ID</b>	E-BUS-4-SIGN
<b>Purpose</b>	Signing a document by using the signature alias and PIN stored at the CREDENTIAL Provider.
<b>Human Actor</b>	InfoCert Customer
<b>System Actors</b>	<ul style="list-style-type: none"> <li>• CREDENTIAL Identity Provider</li> <li>• InfoCert Remote Sign Service</li> <li>• Dike Software</li> </ul>
<b>Legal Actors</b>	<ul style="list-style-type: none"> <li>• InfoCert Subscription form</li> <li>• Legalmail contract</li> </ul>
<b>Pre-conditions</b>	<ul style="list-style-type: none"> <li>• User has stored his signature alias and PIN in CREDENTIAL</li> </ul>
<b>Post-conditions</b>	The document is signed.
<b>Scenario</b>	<p>Bob has a Remote Digital Signature credential. His key pair and the associated Qualified Certificate are stored within a HSM managed by InfoCert. In order to digitally sign his document/s he needs to download the software Dike and to know 3 important data.</p> <ul style="list-style-type: none"> <li>- The alias that's the reference to his Remote Digital Signature credential (the key pair and certificate).</li> <li>- The signature PIN.</li> <li>- An OTP, usually sent via SMS or generated by means of a token.</li> </ul> <p>Within Dike, he can use CREDENTIAL to store in the wallet his alias and signature pin: in this way he can easily authenticates to CREDENTIAL when signing avoiding to clearly type these information on the device he is using (PC, SmartPhone, Tablet, etc.).</p>
<b>Image</b>	<pre>             graph TD                 CIP[CREDENTIAL Identity Provider]                 DS[Dike Software]                 IC[InfoCert Customer]                 IRSS[InfoCert Remote Sign Service]                 UC1([Using CREDENTIAL Wallet for remote digital signature])                 UC2([Using CREDENTIAL Wallet for remote signature alias and PIN])                  CIP --&gt; UC1                 DS --&gt; UC1                 IC --&gt; UC1                 IRSS --&gt; UC1                 CIP --&gt; UC2                 DS --&gt; UC2                 IC --&gt; UC2                 IRSS --&gt; UC2             </pre>

### 4.3.5.5 Editing Architectural Plans

<b>Story Name</b>	Editing Architectural Plans
<b>ID</b>	E-BUS-5-AP
<b>Purpose</b>	Building owner (Bob) wants to change the architectural plans of a building.
<b>Human Actor</b>	<ul style="list-style-type: none"> <li>• Building Owner</li> <li>• Architect</li> </ul>
<b>System Actors</b>	<ul style="list-style-type: none"> <li>• CREDENTIAL Wallet</li> <li>• Legaldoc Service</li> <li>• Legalmail Service</li> </ul>
<b>Legal Actors</b>	<ul style="list-style-type: none"> <li>• State Engineer</li> </ul>
<b>Pre-conditions</b>	<ul style="list-style-type: none"> <li>• All users have CREDENTIAL account.</li> <li>• All users have Legaldoc account.</li> <li>• All users have Legalmail account.</li> <li>• Building owner has stored architectural plan in CREDENTIAL.</li> </ul>
<b>Post-conditions</b>	Building owner saves the final version of architectural plans in CREDENTIAL Wallet.
<b>Scenario</b>	<p>Bob needs to rearrange the rooms of a floor to his building plans to make some offices. So Bob needs to change the architectural plan with an updated version.</p> <p>Bob retrieves the architectural plans from Legaldoc using the CREDENTIAL Wallet as Identity provider. After getting the plans from Legaldoc, he encrypts and uploads into the CREDENTIAL Wallet. Subsequently Bob creates two proxy-re-encryption keys for Archi and Sam (State engineer) for editing and verifying the architectural plans. Then Bob sends an email to Archi (Architect), using Legalmail as mail service. So from now on, Bob will be offline until he receives the confirmation email of the procedure termination.</p> <p>Archi receives email from the Bob to apply the changes on architectural plans. Archi downloads the plans using the proxy-re-encryption key. Archi decrypts the architectural plans using CREDENTIAL and makes the changes on plans. In the end, he saves the re-encrypted plans and uploads them in Credential Wallet.</p> <p>After that, CREDENTIAL Wallet sends a notification to Sam (State engineer) to inform him about the architecture plans. Sam receives the plans from Credential Wallet using the proxy-re-encryption key and acts as follow. Decrypts the plans with CREDENTIAL technology and verifies the changes on the architectural plans. Encrypts and finally uploads the architectural plans into CREDENTIAL Wallet.</p> <p>Finally, CREDENTIAL Wallet receives the architectural plans and notifies the offline Bob to check the architectural plans. After that Bob uploads the final version of the plans into Legaldoc.</p>
<b>Image</b>	<pre> graph TD     BO[Building Owner]     Arch[Architect]     CW[CREDENTIAL Wallet]     LS[Legaldoc Service]     LMS[Legalmail Service]     CAP((Change Architectural Plan))     VAP((Verify Architectural Plans))      BO --&gt; CAP     Arch --&gt; CAP     CW --&gt; CAP     LS --&gt; CAP     BO --&gt; VAP     Arch --&gt; VAP     CW --&gt; VAP     LMS --&gt; VAP     VAP -.-&gt; CAP     </pre>

### 4.3.5.6 Business report ordering by Company

<b>Story Name</b>	Business report ordering by Company
<b>ID</b>	E-BUS-6-BR
<b>Purpose</b>	Business report is being received and verified by Consultant.
<b>Human Actor</b>	<ul style="list-style-type: none"> <li>• Company director (Ordering Business report)</li> <li>• Analyst (Verifying Business report)</li> </ul>
<b>System Actors</b>	<ul style="list-style-type: none"> <li>• Legaldoc Service (managing users data)</li> <li>• CREDENTIAL Wallet (CREDENTIAL Identity Provider)</li> <li>• Legalmail Service (managing users electronic mails)</li> </ul>
<b>Legal Actors</b>	-
<b>Pre-conditions</b>	<ul style="list-style-type: none"> <li>• Legaldoc Service.</li> <li>• Users have CREDENTIAL account.</li> <li>• Users have stored signature alias, public key.</li> <li>• Users have Legalmail account.</li> <li>• Users can use CREDENTIAL technics (Encryption and Decryption).</li> </ul>
<b>Post-conditions</b>	Business report is verified and stored in Legaldoc.
<b>Scenario</b>	<p>Codie (Company director) decides to make an order for his Company.</p> <p>Codie makes the order for his company and he uses C. Wallet (with his public key) to encrypt the order. He stores the order in C. Wallet and sends a notification request to Anna(Analyst) via Legalmail. Anna decrypts the business order and checks/verifies it. After the verification step she creates the business report. Encrypts and stores business report into C. Wallet. Then she sends a notification back to Codie. Codie decrypts with C. Wallet and reads it.</p> <p>The process stops when he stores the business report in Legaldoc.</p>
<b>Image</b>	

### 4.3.6 Business Use Cases

The six eBusiness storyboards are described specifically in 10 BUCs. The following table provides an overview:

Use Case Name	Unique ID	Main Actor
<b>Account association between Legalmail and CREDENTIAL</b>	E-BUS-1-LMAIL-A	Legalmail User
<b>Using CREDENTIAL ID to login to InfoCert Legalmail</b>	E-BUS-1-LMAIL-B	Legalmail User
<b>Activating message forward for encrypted Legalmail</b>	E-BUS-2-LMAIL	Legalmail User
<b>Import data from CREDENTIAL Wallet to create the contract to be signed to activate Legalmail</b>	E-BUS-3-SHOP	InfoCert Customer
<b>Using CREDENTIAL Wallet to store remote signature alias and PIN</b>	E-BUS-4-SIGN-A	InfoCert Customer
<b>Using CREDENTIAL Wallet for remote digital signature</b>	E-BUS-4-SIGN-B	InfoCert Customer
<b>Change Architectural Plan</b>	E-BUS-5-AP-A	Building Owner
<b>Verify Architectural Plans</b>	E-BUS-5-AP-B	State Engineer
<b>Business Report Request</b>	E-BUS-6-BR-A	Company Director
<b>Business Report Response</b>	E-BUS-6-BR-B	Analyst

Table 23: eBusiness specific BUCs

All use cases are formally specified in Appendix 1A.3.3.

The following table now show which of the above BUCs are associated with which of the eBusiness storyboards defined before:

	Set up login to Legalmail by using CREDENTIAL	Activate encrypted Legalmail forward	Import data into Legalmail subscription form. Choose CREDENTIAL for authentication	Signing a document by using a remote digital signature credential stored in a HSM	Editing Architectural Plans	Business report ordering by Company
<b>Account association between Legalmail and CREDENTIAL</b>	✓					
<b>Using CREDENTIAL ID to login to InfoCert Legalmail</b>	✓					
<b>Activating message forward for encrypted Legalmail</b>		✓				
<b>Import data from CREDENTIAL Wallet to create the contract to be signed to activate Legalmail</b>			✓			

	Set up login to Legalmail by using CREDENTIAL	Activate encrypted Legalmail forward	Import data into Legalmail subscription form. Change Architectural Plan					✓	
Verify Architectural Plans					✓	
Business Report Request						✓
Business Report Response						✓

Table 24: Relation of BUCs and story boards in the eBusiness pilot

## 5 Conclusion

This document introduced the use cases for a CREDENTIAL Wallet. We distinguish between generic use cases and Pilot Specific use cases. We started by identifying generic business and logical use cases which describe what the CREDENTIAL Wallet can offer as functionality. Each pilot derived from these ideas multiple storyboards in their domain.

We identified a total of 33 generic business use cases and 108 generic logical use cases. All of them together describing the whole functionality of the CREDENTIAL Wallet as an IAM in the cloud and a data sharing platform for user and services.

The future work based on these results are identification and selection of applicable technologies for the CREDENTIAL Wallet, the architecture design of the CREDENTIAL Wallet, the requirements, and the preparation of the pilots. There exists already multiple variants of Proxy-Re-Encryption and Malleable Signature algorithms as well as IAM protocols like OpenID, SAML and XACML. The use cases will guide these decision thus that the best fitting technology for the CREDENTIAL Wallet is selected and further extended according to the feature described by the use cases.

The architecture design is the next big step towards the implementation. Some architectural design decisions might have already been made by the use cases and will be further discussed in the corresponding work packages.

The use cases will help by deriving the requirements for the CREDENTIAL Wallet. Different aspects like functionality, security, privacy, usability, etc. have to be considered and should be fully covered by the use cases developed in this document. By using Redmine we are able to keep track of the use cases and their corresponding requirements. If changes need to be done, for example because some privacy and security requirements can contradict each other, we are able to do so.

Finally, the pilots can use their proposed business use cases and refine them in logical use cases and Technical use cases where special characteristics of each pilot can be taken into account.

# A Formal Specifications of Use Cases

## A.1 Generic Business Use Cases

### A.1.1 Data Management

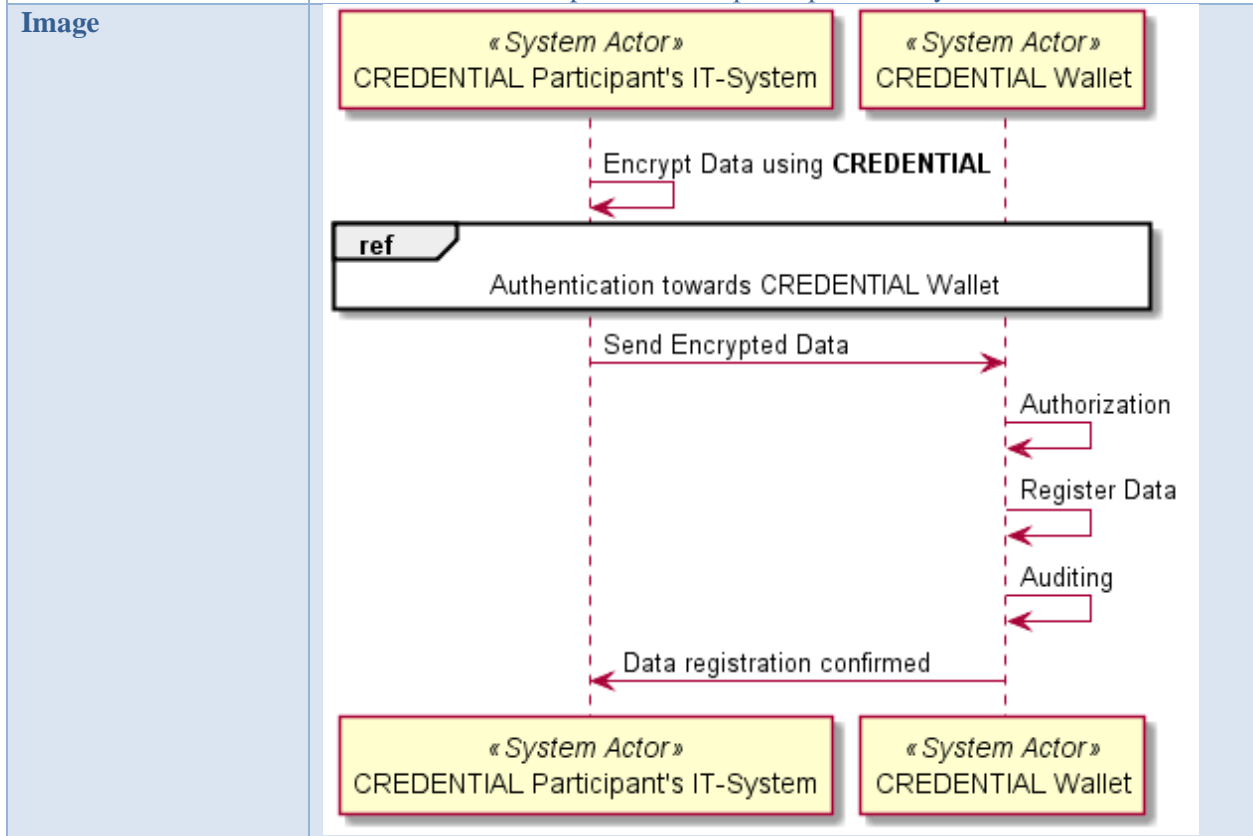

#### A.1.1.1 Export CREDENTIAL Wallet data into form

<b>Use Case Name</b>	<b>Export CREDENTIAL Wallet data into form</b>
<b>ID</b>	G-BUC-EXPFORM
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant's IT-System - Service Provider
<b>Pre-conditions</b>	- Service Provider needs to have CREDENTIAL Key Material
<b>Post-conditions</b>	- CREDENTIAL Data is unencrypted available at the Service Provider
<b>Description</b>	A user provides a form to the CREDENTIAL Wallet. The CREDENTIAL Wallet re-encrypts the user's data and fills them into the form. A human interaction is possible with participant's IT system.
<b>Image</b>	

### A.1.1.2 Send Data

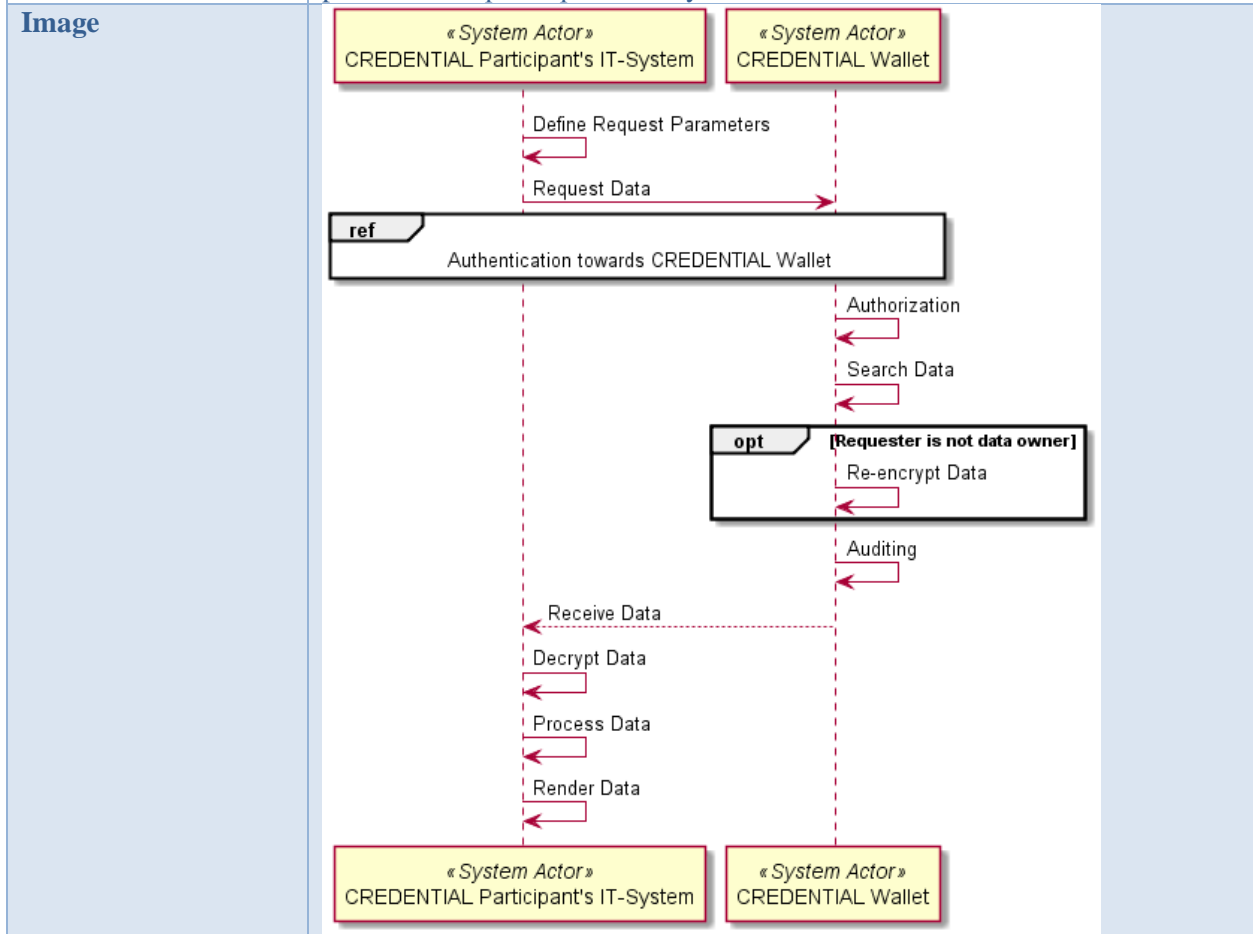

<b>Use Case Name</b>	<b>Send Data</b>
<b>ID</b>	G-BUC-SENDDATA
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Wallet
<b>Pre-conditions</b>	- User has a CREDENTIAL account - User has write access rights
<b>Post-conditions</b>	- Data is registered in the wallet
<b>Description</b>	A user sends data from his IT-System to CREDENTIAL Wallet or to a Service Provider protected by CREDENTIAL technology. The user encrypts his data using CREDENTIAL technology. He authenticates himself against the wallet and submits the data to the wallet. The wallet performs an authorization on the performed action. After a successfully authorization the data is registered in the wallet. When the process is finished the wallet performs an auditing of every previous action performed in this step. A human interaction is possible with participant's IT system.

### A.1.1.3 Read Data

<b>Use Case Name</b>	<b>Read Data</b>
<b>ID</b>	G-BUC-READDATA
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant's IT-System
<b>Pre-conditions</b>	- Participant has a CREDENTIAL account - Participant has read access rights
<b>Post-conditions</b>	- Data is decrypted on participant's IT-System
<b>Description</b>	A CREDENTIAL participant reads data from the CREDENTIAL Wallet. The participant defines request parameters which specify the requested data. The participant authenticates himself against the wallet. The wallet performs an authorization. After a successful authorization the data is searched. In case the requester is not the data owner, the data is re-encrypted. The wallet performs auditing of every previous steps and sends the data back to be participant. The participant decrypts, processes and renders the data. A human interaction is possible with participant's IT system.

### A.1.1.4 Forward Data

<b>Use Case Name</b>	<b>Forward Data</b>
<b>ID</b>	G-BUC-FORWARDDATA
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant's IT-System
<b>Pre-conditions</b>	- The participant who grants access rights needs the right to grant read access - Both participants have a CREDENTIAL account
<b>Post-conditions</b>	- The receiving participant has read access rights
<b>Description</b>	A CREDENTIAL participant forwards data from the CREDENTIAL Wallet to another CREDENTIAL participant. In order to forward data, the participant has to grant read access rights to the receiving participant. After successfully granted access rights the wallet sends a notification to the receiving participant's IT-System. The receiving participant performs a read data on the specified data.
<b>Image</b>	

### A.1.1.5 Send Notification

<b>Use Case Name</b>	<b>Send Notification</b>
<b>ID</b>	G-BUC-SENDNOTIFICATION
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant's IT-System
<b>Pre-conditions</b>	- A notification on a specific event is registered in the wallet - Participant has a CREDENTIAL account
<b>Post-conditions</b>	- The participant has received a notification about a specific event
<b>Description</b>	The wallet recognizes an externally triggered event. An event can be for example a reading of data, writing of data or granting of access rights. The wallet evaluates a notification configuration. For each participant who wants to be notified a Notification is created and sent to the participant. The participant processes the notification if necessary.
<b>Image</b>	

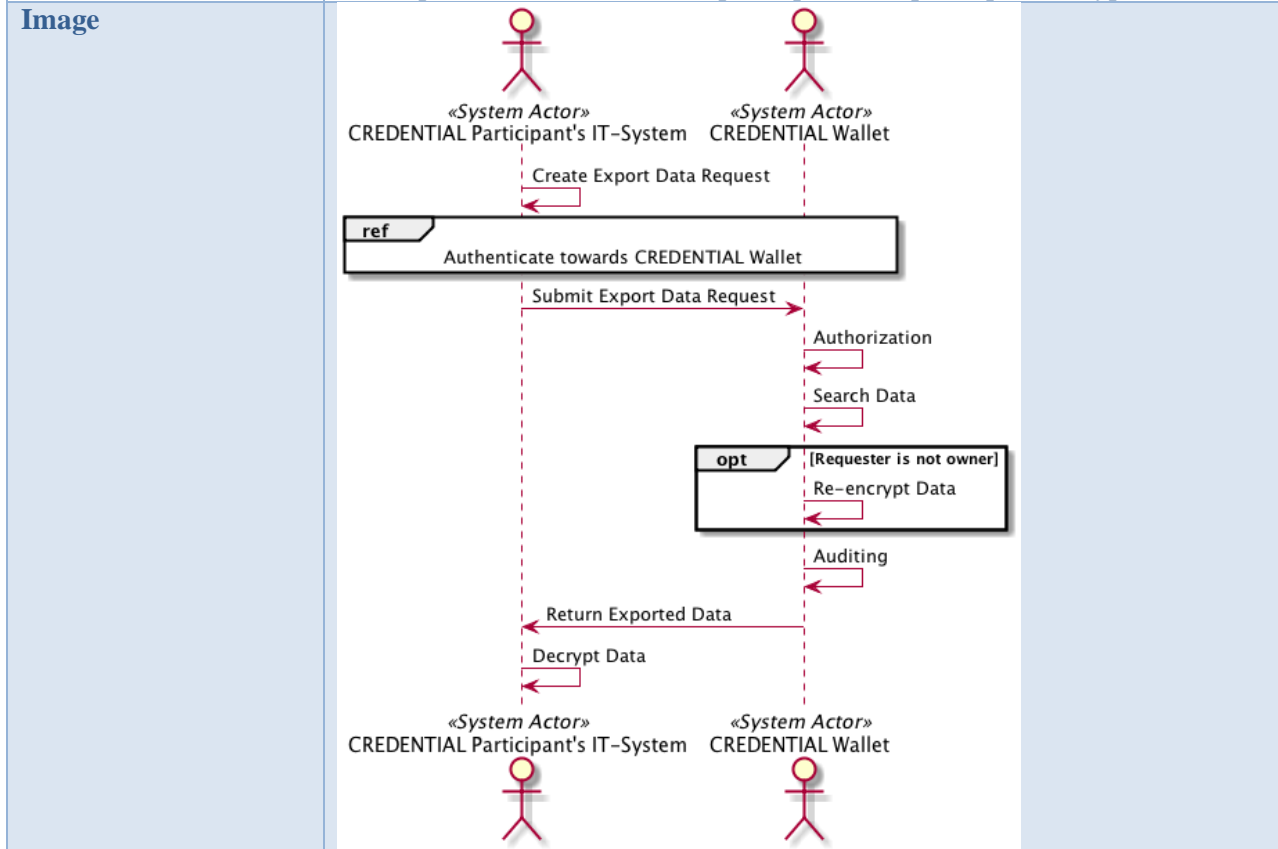

### A.1.1.6 Delete Data Set

<b>Use Case Name</b>	<b>Delete Data Set</b>
<b>ID</b>	G-BUC-DELETEDDATASET
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant's IT-System
<b>Pre-conditions</b>	- The participant has delete rights on the data set - The participant logged-in on the CREDENTIAL Wallet
<b>Post-conditions</b>	- The specified data set is deleted
<b>Description</b>	A participant creates a delete data request. He specifies which data set should be deleted. He authenticates himself against the wallet and sends the delete request to the wallet. The wallet performs the authorization on the given operation. After a successful authorization the wallet deletes the data record.
<b>Image</b>	<pre> sequenceDiagram     actor IT as «System Actor» CREDENTIAL Participant's IT-System     actor Wallet as «System Actor» CREDENTIAL Wallet      IT-&gt;&gt;IT: Create Delete Data Request     Note over IT, Wallet: ref Authenticate towards CREDENTIAL Wallet     IT-&gt;&gt;Wallet: Submit Delte Data Request     Wallet-&gt;&gt;Wallet: Authorization     Wallet-&gt;&gt;Wallet: Delete Data     </pre>

### A.1.1.7 Export Data from Wallet

<b>Use Case Name</b>	<b>Export Data from Wallet</b>
<b>ID</b>	G-BUC-EXPORTDATA
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant's IT-System
<b>Pre-conditions</b>	- The participant is logged-in on the CREDENTIAL Wallet - The participant has read access rights on the data
<b>Post-conditions</b>	- The data is exported and decrypted on the participant's IT-System
<b>Description</b>	A participant creates an export data request. He authenticates himself against the wallet and sends the export request to the wallet. The wallet performs an authorization. After a successful authorization the wallet searches the data. If the requester is not the data owner by himself, then the wallet performs a re-encryption of the data. The wallet audits every previously performed action. The exported data is send to the participant. The participant decrypts the data.

### A.1.1.8 View all accesses to my Data

<b>Use Case Name</b>	<b>View all accesses to my Data</b>
<b>ID</b>	G-BUC-VIEWACCESSES
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Wallet
<b>Pre-conditions</b>	- The participant is the data owner
<b>Post-conditions</b>	- A List of all accesses to the participant's data are displayed to the participant. - An audit log of this action is available at the CREDENTIAL Wallet
<b>Description</b>	The participant creates a view all access to his data request. He authenticates himself against the CREDENTIAL Wallet and submits the view all access request to the wallet. The wallet performs an authorization. After a successful authorization the wallet searches for all access to the the participant's data. The wallet performs an auditing of every previous performed action. The wallet returns the list of all accesses to the participant.
<b>Image</b>	<pre> sequenceDiagram     actor IT as «System Actor» CREDENTIAL Participant's IT-System     actor Wallet as «System Actor» CREDENTIAL Wallet      Note over IT: Create View All Accesses Request     Note over IT: [ref] Authenticate towards CREDENTIAL Wallet     IT-&gt;&gt;Wallet: Submit View All Accesses Request     Note over Wallet: Authorization     Note over Wallet: Search all Accesses     Note over Wallet: Auditing     Wallet--&gt;&gt;IT: Return List of all Accesses     </pre>

### A.1.1.9 Recover CREDENTIAL Wallet Data

<b>Use Case Name</b>	<b>Recover CREDENTIAL Wallet data</b>
<b>ID</b>	G-BUC-RECOVERDATA
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant's IT-System - CREDENTIAL Participant's Cold Storage
<b>Pre-conditions</b>	- User has a CREDENTIAL account - User has a recovery key registered in CREDENTIAL and stored offline
<b>Post-conditions</b>	- User has a new main key pair - Data is re-encrypted so it can be controlled with the new key pair - Re-Encryption Keys have been re-computed
<b>Description</b>	Participants will mostly have their private keys to access the CREDENTIAL data stored in some secure HW in their own devices. While this is the most convenient option, it has to be considered what happens when the device (and the private key) is lost but there is need to access the old CREDENTIAL Wallet, and the data is stored in it. In traditional systems, this would mean authenticating the participant by an alternative mean (email, SMS) and generating a new key pair. However, for the CREDENTIAL Wallet, as the data is encrypted, this is not feasible. The existing data should also be re-encrypted so it can be used with the new key pair. Hence, the best approach is to have a separate recovery key pair and its corresponding re-encryption key. The same recovery key will serve as a mean to authenticate the user and trigger the re-encryption and it will be established as the new man key. A new recovery key must be generated and sent to the wallet.
<b>Image</b>	<pre> sequenceDiagram     actor CA as «System Actor» Participant's cold storage     actor CB as «System Actor» CREDENTIAL Participant's IT-System     actor CC as «System Actor» CREDENTIAL Wallet      CA-&gt;&gt;CB: Read Recovery Private Key     activate CB     CB-&gt;&gt;CB: Create Recovery Request     CB-&gt;&gt;CC: Submit Recovery Request     activate CC     CC-&gt;&gt;CC: Search User     CC-&gt;&gt;CB: Verify Recovery request     deactivate CC     Note over CB: Re-Encryption Keys from my old identity to another participant have to be provided in this request     CC-&gt;&gt;CB: Re-encrypt Data     deactivate CC     CB-&gt;&gt;CB: Re-Generate Access Rights     CB-&gt;&gt;CB: Generate new Recovery Key     CB-&gt;&gt;CA:      deactivate CB     CC-&gt;&gt;CC: Auditing     deactivate CC     </pre>

## A.1.2 Authentication

### A.1.2.1 Authentication using SmartCard

<b>Use Case Name</b>	<b>Authentication using SmartCard</b>
<b>ID</b>	G-LUC-AUTHSMARTCARD
<b>LUC_in</b>	Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and Identity Federation
<b>Main Actor</b>	- eID
<b>Secondary Actors</b>	- CREDENTIAL Participant
<b>Pre-conditions</b>	- User is registered in the eID system - User has a valid smartcard
<b>Post-conditions</b>	- The user is authenticated to e-ID system
<b>Description</b>	The user has to validate the identity against an electronic ID system, using a two-factor authentication based on smartcard technology. The smartcard must be inserted in the e-ID system. The user must type a valid PIN.
<b>Image</b>	<pre> sequenceDiagram     actor User as «Human Actor» User     actor eID as «System Actor» eID     User-&gt;&gt;eID: Inserts smartcard     activate eID     eID-&gt;&gt;eID: Process smartcard     deactivate eID     eID-&gt;&gt;User: Asks to enter associated PIN     User-&gt;&gt;eID: Inserts PIN     activate eID     eID-&gt;&gt;eID: Validates PIN     deactivate eID     alt [Successful case]         eID-&gt;&gt;User: Valid credentials     else [NOT valid PIN]         eID-&gt;&gt;User: Cancel authentication     end     </pre>

### A.1.2.2 Logout from CREDENTIAL Wallet

<b>Use Case Name</b>	<b>Logout from CREDENTIAL Wallet</b>
<b>ID</b>	G-BUC-LOGOUTWALLET
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant's IT-System
<b>Pre-conditions</b>	- The user has a valid session on the CREDENTIAL Wallet
<b>Post-conditions</b>	- The user's session is expired
<b>Description</b>	The participant selects the logout functionality. The CREDENTIAL Wallet processes the participant's logout request. If the participant has a valid session the CREDENTIAL Wallet invalidates this session. The CREDENTIAL Wallet write a log entry for the logout process. A human interaction is possible with participant's IT system.
<b>Image</b>	<pre> sequenceDiagram     actor IT as «System Actor» CREDENTIAL Participant's IT-System     actor Wallet as «System Actor» CREDENTIAL Wallet      IT-&gt;&gt;IT: Create Logout Request     IT-&gt;&gt;Wallet: Submit Logout Request     Wallet-&gt;&gt;Wallet: Authorization     Wallet-&gt;&gt;Wallet: Invalidate Session     Wallet-&gt;&gt;Wallet: Auditing     Wallet--&gt;&gt;IT: Respond Successfully logout     </pre>

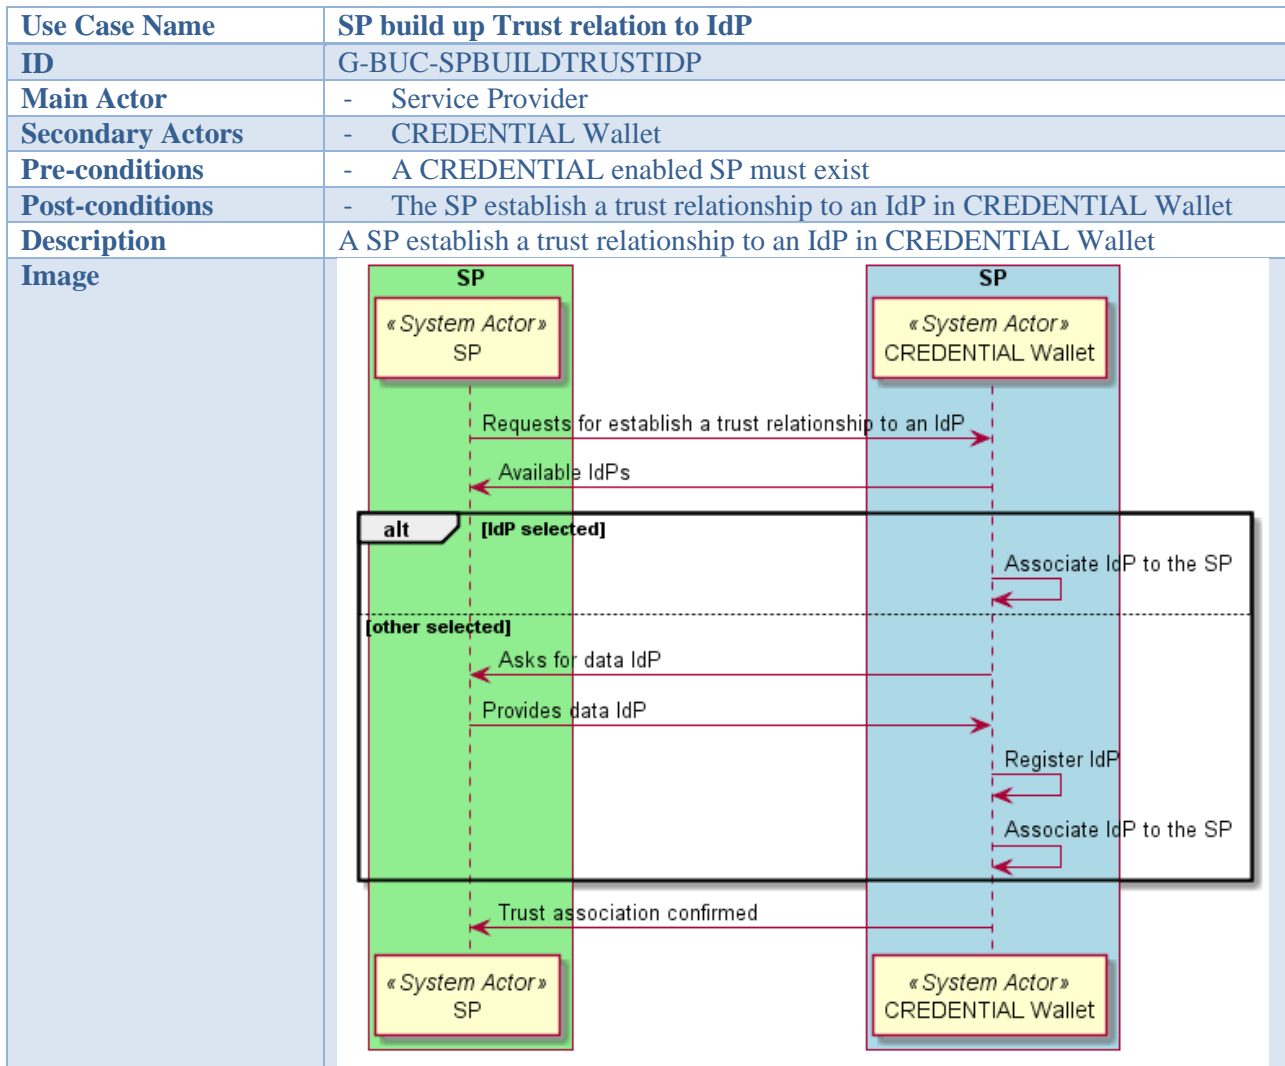

### A.1.2.3 Authenticate towards CREDENTIAL Wallet

<b>Use Case Name</b>	<b>Authenticate towards CREDENTIAL Wallet</b>
<b>ID</b>	G-BUC-AUTHWALLET
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Authentication Service
<b>Pre-conditions</b>	- User has an account - User has access to his credentials
<b>Post-conditions</b>	- User has an Identity Assertion - User is able to access CREDENTIAL services
<b>Description</b>	The user wants to authenticate against the CREDENTIAL Wallet. He uses the CREDENTIAL Authentication Service and provide his credentials. The CREDENTIAL Authentication Service verifies the credentials and issues an Identity Assertion for the user. The user is able to access any CREDENTIAL Wallet service with this Identity Assertion. A human interaction is possible with participant's IT system.
<b>Image</b>	<pre> sequenceDiagram     actor IT as CREDENTIAL Participant's IT-System     actor AS as CREDENTIAL Authentication Service     IT-&gt;&gt;AS: Provides credentials     alt [successful verification]         AS-&gt;&gt;AS: Verifies credentials         AS-&gt;&gt;AS: Auditing         AS--&gt;&gt;IT: Return Identity Assertion     else          AS-&gt;&gt;AS: Auditing         AS--&gt;&gt;IT: Return Unsuccessfull Authentication     end     </pre>

### A.1.2.4 SP build up Trust relation to IdP

### A.1.2.5 Access Service Provider

<b>Use Case Name</b>	<b>Access Service Provider</b>
<b>ID</b>	G-LUC-ACCESSSP
<b>LUC_in</b>	Export CREDENTIAL Wallet data into form
<b>Main Actor</b>	- CREDENTIAL Participant
<b>Secondary Actors</b>	- CREDENTIAL Participant's IT-System - Service Provider
<b>Pre-conditions</b>	
<b>Post-conditions</b>	
<b>Description</b>	A user uses his IT-System to access some functionality on a service provider.
<b>Image</b>	<pre> sequenceDiagram     actor User as «Human Actor» User     actor IT as «System Actor» CREDENTIAL Participant's IT-System     actor SP as «System Actor» Service Provider      User--&gt;&gt;IT: Uses     IT-&gt;&gt;SP: Access     SP-&gt;&gt;SP: Process Access     </pre>

### A.1.3 Authorization

#### A.1.3.1 Request Access Rights

<b>Use Case Name</b>	<b>Request Access Rights</b>
<b>ID</b>	G-BUC-REQACCESSRIGHTS
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant's IT-System
<b>Pre-conditions</b>	- Participant 1 is not the data owner - Participant 2 is the data owner - Both participants have a CREDENTIAL account
<b>Post-conditions</b>	- Participant 2 has received the request for access rights
<b>Description</b>	A participant who is not a data owner requests access rights to data stored in the CREDENTIAL Wallet. The wallet authenticates the requester and registers the access rights request. The wallet identifies the data owner and submits the access rights request to the data owner. A human interaction is possible with participant's IT system.
<b>Image</b>	

### A.1.3.2 Grant Access Rights

<b>Use Case Name</b>	<b>Grant Access Rights</b>
<b>ID</b>	G-BUC-GRANTACCESSRIGHTS
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant's IT-System
<b>Pre-conditions</b>	- Both participants have CREDENTIAL accounts.
<b>Post-conditions</b>	- The access rights are registered in the wallet.
<b>Description</b>	<p>A CREDENTIAL participant grants access rights to his data in the CREDENTIAL Wallet to another participant. There are three different scenarios. The participant who is the data owner defines the access rights on its own, a participant who receives a request access rights confirms the request and a participant who has grant access rights privileges defines access rights for another participant. In all scenarios the access rights will be provided to the wallet. The wallet performs an authorization on the request. On successful authorization the access rights will be registered. A human interaction is possible with participant's IT system.</p>
<b>Image</b>	<pre> sequenceDiagram     actor A1 as «System Actor» CREDENTIAL Participant's 1 IT-System     actor A2 as «System Actor» CREDENTIAL Wallet     actor A3 as «System Actor» CREDENTIAL Participant's 2 IT-System      alt [Data Owner Defines Access Rights]         A1-&gt;&gt;A3: Define Access Rights         A3--&gt;&gt;A1: Grant Access Rights         A3-&gt;&gt;A2: Provide Access Rights     and ref Authenticate towards CREDENTIAL Wallet     end      alt [Data Owner Confirms Requested Access Rights]         A3-&gt;&gt;A1: Grant Access Rights         A1-&gt;&gt;A2: Provide Access Rights     and ref Authenticate towards CREDENTIAL Wallet     end      alt [User with Grant Access Rights privilege defines Access Rights]         A3-&gt;&gt;A1: Define Access Rights         A1--&gt;&gt;A3: Grant Access Rights         A1-&gt;&gt;A2: Provide Access Rights     and ref Authenticate towards CREDENTIAL Wallet     end      A2-&gt;&gt;A1: Authorization     A2-&gt;&gt;A1: Register Access Rights     A2-&gt;&gt;A1: Auditing     </pre>

### A.1.3.3 Re-Generate Access Rights

<b>Use Case Name</b>	<b>Re-Generate Access Rights</b>
<b>ID</b>	G-BUC-REGENACCESSRIGHTS
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Wallet - CREDENTIAL Participant's IT-System - CREDENTIAL Re-Encryption Key Generation Service
<b>Pre-conditions</b>	- User is authenticated to the CREDENTIAL Wallet - User has a CREDENTIAL Account - User has provided access rights to participants - Participant receives a successfully response about his recover request
<b>Post-conditions</b>	- Re-encryption keys have been generated for the new private key - Re-encryption keys are updated in the CREDENTIAL Wallet
<b>Description</b>	Whenever a participant modifies its master key-pair, all their re-encryption keys based on them are no longer valid. Hence, it is required to re-generate the re-encryption keys associated to access rights already provided to the wallet. The participant requests a list of all access rights associated to his account and then re-generate the access rights based with new key-material. The Access Rights are re-generated and provided to the wallet. A participant receives a successfully response that his credentials for CREDENTIAL Wallet have been updated. In order to fully complete this request he has to update the re-encryption keys that are stored within the Wallet.
<b>Image</b>	<pre> sequenceDiagram     actor IT as «System Actor» CREDENTIAL Participant's IT-System     actor Wallet as «System Actor» CREDENTIAL Wallet     actor Auth as «System Actor» CREDENTIAL Authorization Service     actor Gen as «System Actor» CREDENTIAL Re-Encryption Key-Generation Service      Note over IT, Auth: From participant, who has recovered his credentials, to other participant.     IT-&gt;&gt;Auth: Query Re-Encryption Keys     Auth--&gt;&gt;IT: Create Recover Data Response     Note over IT: Add participant to whom re-encryption keys have to be re-generated     IT-&gt;&gt;Auth: Submit Data Response     Auth--&gt;&gt;IT: Read Participant Identifications     loop [Participant Identifications]         IT-&gt;&gt;Gen: Generate Re-Encryption Key     end     Note over IT: Create Updated Re-Encryption Key-List     IT-&gt;&gt;Gen: Submit Update Re-Encryption Key-List     Note over Gen: Process Update Re-Encryption Key-List     Note over IT, Wallet: [Re-Encryption Keys]     IT-&gt;&gt;Wallet: Update Re-Encryption Key     </pre>

## A.1.4 Account Management

### A.1.4.1 Link Service Provider account with CREDENTIAL account

<b>Use Case Name</b>	<b>Link Service Provider account with CREDENTIAL account</b>
<b>ID</b>	G-BUC-LINKSPWITHCRED
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- Service Provider - CREDENTIAL Wallet
<b>Pre-conditions</b>	- User has both accounts, the CREDENTIAL account and the SP account
<b>Post-conditions</b>	- CREDENTIAL account and the SP account are linked
<b>Description</b>	A user links his CREDENTIAL Account to his Service Provider account. He is able to login to his Service Provider account using his CREDENTIAL account. A human interaction is possible with participant's IT system.
<b>Image</b>	<pre> sequenceDiagram     actor IT as «System Actor» CREDENTIAL Participant's IT-System     actor SP as «System Actor» Service Provider     actor CW as «System Actor» CREDENTIAL Wallet      IT-&gt;&gt;SP: Authenticate user     SP-&gt;&gt;CW: Create Link Account Request using CREDENTIAL     CW-&gt;&gt;IT: Redirect User to CREDENTIAL Authentication     Note over CW: Provide Callback URL     ref         IT-&gt;&gt;CW: Authentication towards CREDENTIAL Wallet     end     CW-&gt;&gt;SP: Provide Link Account Request     CW-&gt;&gt;CW: Authorization     CW-&gt;&gt;CW: Register Link Account Request     Note over CW: Send to Callback URL     CW-&gt;&gt;SP: Request Identity Assertion     CW-&gt;&gt;CW: Authorization     CW-&gt;&gt;CW: Re-encrypt Attributes     CW-&gt;&gt;CW: Issue Identity Assertion     CW-&gt;&gt;CW: Auditing     CW-&gt;&gt;SP: Receive Identity Assertion     Note over CW: Send notification to the user     SP-&gt;&gt;IT: Decrypt Identity Assertion     SP-&gt;&gt;IT: Link Accounts     </pre>

### A.1.4.2 Register new CREDENTIAL Account

<b>Use Case Name</b>	<b>Register new CREDENTIAL Account</b>
<b>ID</b>	G-BUC-REGCREDACCOUNT
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Wallet
<b>Pre-conditions</b>	- The participant has no account on the CREDENTIAL Wallet - The participant has locally access to a "Proxy-Re-Encryption-Ready" Key Generation Service
<b>Post-conditions</b>	- Public and Private "Proxy-Re-Encryption-Ready"-Keys are generated - CREDENTIAL knows the generated "Proxy-Re-Encryption-Ready"-Public Key - Participant knows the generated "Proxy-Re-Encryption-Ready"-Private Key - Account is linked to the "Proxy-Re-Encryption-Ready"-Public Key
<b>Description</b>	A participant creates a new account on the CREDENTIAL Wallet. He creates a new "Proxy-Re-Encryption-Ready"-Key on his IT-System. He adds additional registration information and creates a CREDENTIAL Account request. This request is send to the wallet. The wallet verifies the request and creates a new participant account on the wallet. The wallet and the provided key by the user are linked together. A human interaction is possible with participant's IT system.
<b>Image</b>	

### A.1.4.3 De-Register From CREDENTIAL

<b>Use Case Name</b>	<b>De-Register From CREDENTIAL</b>
<b>ID</b>	G-BUC-DEREGISTERCREDENTIAL
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant's IT-System
<b>Pre-conditions</b>	- User has account on CREDENTIAL Wallet - User is logged-in on the CREDENTIAL Wallet
<b>Post-conditions</b>	- User's account is closed - Login attempts to this account are no longer possible
<b>Description</b>	A user de-registers from CREDENTIAL Wallet. This implies user's data deletion, i.e. user specific data stored in Wallet, user grants rights given to another user, user notification lists (in terms of devices and types of notification). A human interaction is possible with participant's IT system.
<b>Image</b>	<pre> sequenceDiagram     actor IT_System as «System Actor» CREDENTIAL Participant's IT-System     actor Wallet as «System Actor» CREDENTIAL Wallet     IT_System-&gt;&gt;Wallet: Create De-Register CREDENTIAL account request     activate Wallet     Wallet-&gt;&gt;Wallet: Submit De-Register CREDENTIAL account request     deactivate Wallet     Wallet-&gt;&gt;IT_System: De-register account     deactivate Wallet     </pre>

### A.1.4.4 View Previous Logins to My Account

<b>Use Case Name</b>	<b>View Previous Logins to My Account</b>
<b>ID</b>	G-BUC-VIEWLOGINS
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant's IT-System
<b>Pre-conditions</b>	- A user is logged-in on the CREDENTIAL Wallet
<b>Post-conditions</b>	- A list of previous logins to his accounts is rendered to the user.
<b>Description</b>	A user requests the list of the previous logins to his account. He authenticates himself against the wallet. The wallet queries the list of all previous logins to the account. The wallet returns the list of all previous logins to the user.
<b>Image</b>	<pre> sequenceDiagram     actor Human as «Human Actor» CREREDENTIAL Participant's IT-System     actor System as «System Actor» CREREDENTIAL Wallet      Human-&gt;&gt;Human: Create List Previous Logins Request     ref         Human-&gt;&gt;System: Authenticate towards CREREDENTIAL Wallet     end     Human-&gt;&gt;System: Submit List Previous Logins Request     System-&gt;&gt;System: Query list of previous logins for user     System--&gt;&gt;Human: Return list of previous logins     </pre>

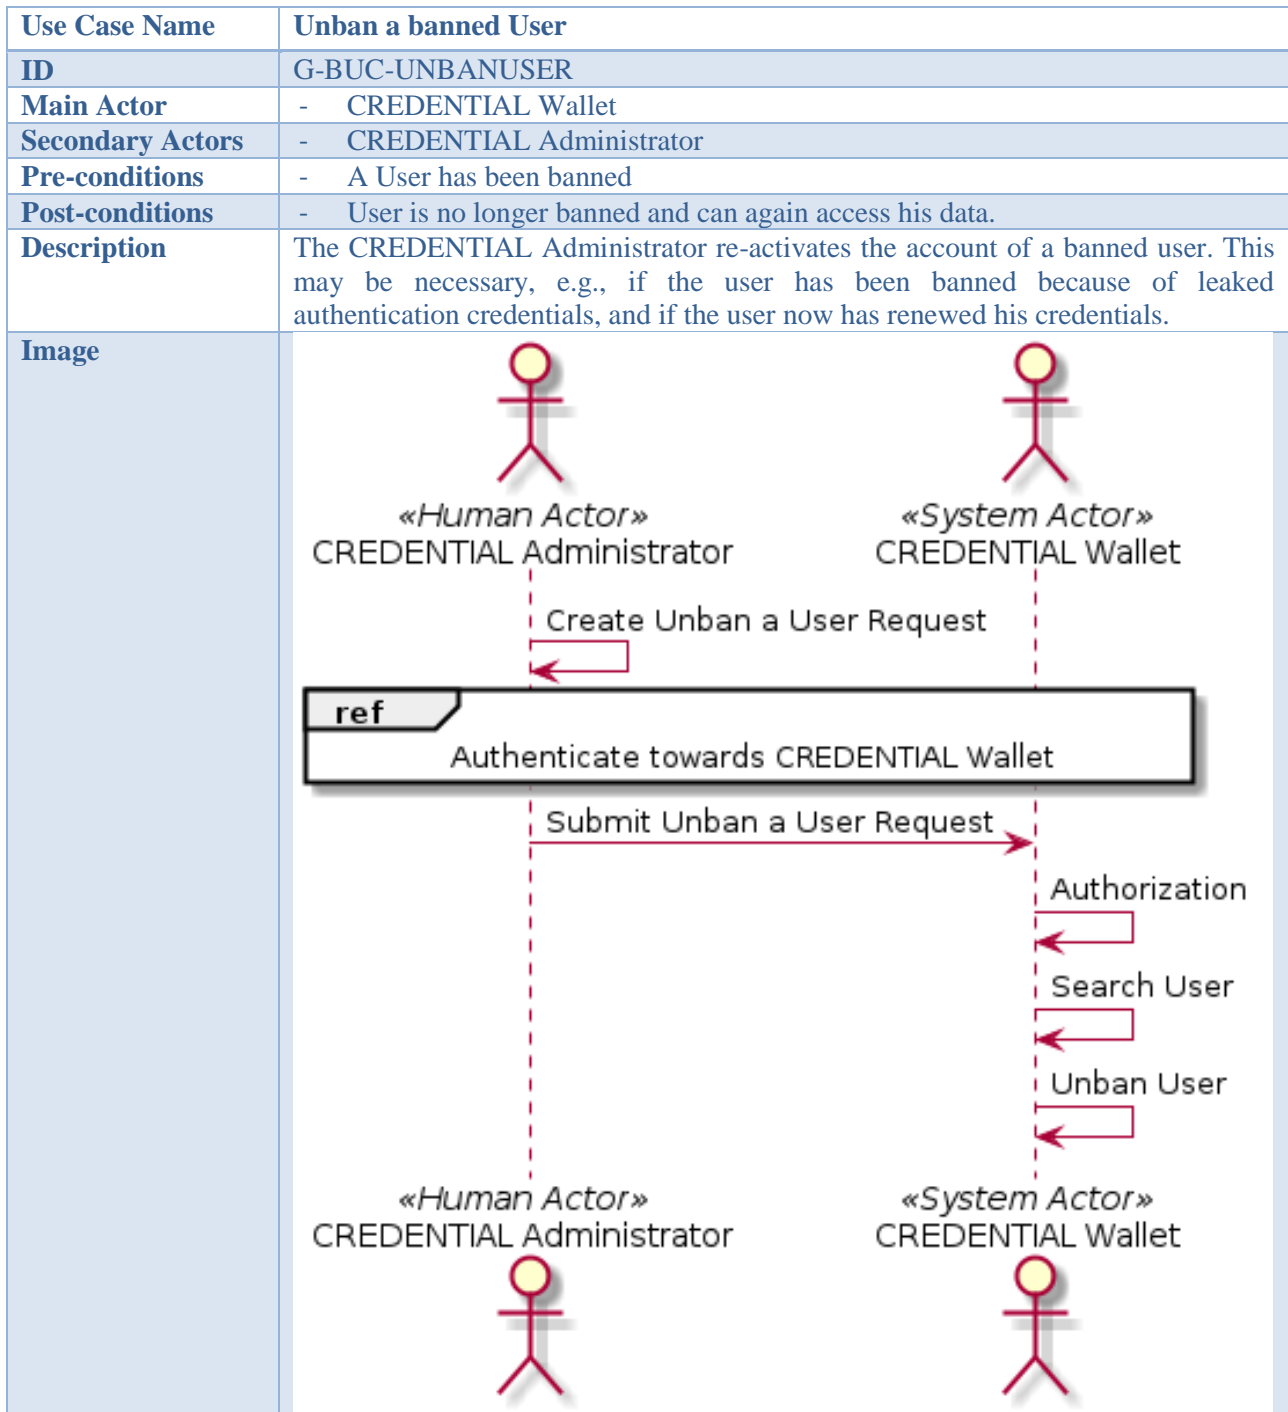

### A.1.4.5 Ban a User

<b>Use Case Name</b>	<b>Ban a User</b>
<b>ID</b>	G-BUC-BANUSER
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Administrator
<b>Pre-conditions</b>	- A User has a CREDENTIAL account - The CREDENTIAL Administrator has admin rights
<b>Post-conditions</b>	- User is no longer able to login. Account is still present at CREDENTIAL Wallet.
<b>Description</b>	The CREDENTIAL Administrator bans a user. The user is no longer able to login to his account.
<b>Image</b>	

### A.1.4.6 Unban a User

### A.1.4.7 Register new device for accessing CREDENTIAL Wallet

<b>Use Case Name</b>	<b>Register new device for accessing CREDENTIAL Wallet</b>
<b>ID</b>	G-BUC-REGNEWDEVICE
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Wallet
<b>Pre-conditions</b>	- User has a CREDENTIAL account in one device - User has a device not associated to a CREDENTIAL account
<b>Post-conditions</b>	- User can access its wallet from both devices
<b>Description</b>	One of the main benefits of having a cloud wallet is that it can be accessed by many devices. While in general several authentication keys can be associated to one identity or to one wallet, the re-encryption mechanisms require one unique private key to control all the data stored in the participants' wallet. A mechanism has to be devised for securely sharing this private key among devices.
<b>Image</b>	<pre> sequenceDiagram     actor A as «System Actor» CREDENTIAL Participant's IT-System A     actor B as «System Actor» CREDENTIAL Participant's IT-System B     actor W as «System Actor» CREDENTIAL Wallet      A-&gt;&gt;A: Export private key     A-&gt;&gt;B: Transmit private key     B-&gt;&gt;W: Import private key     W-&gt;&gt;B: Authentication towards CREDENTIAL Wallet     </pre>

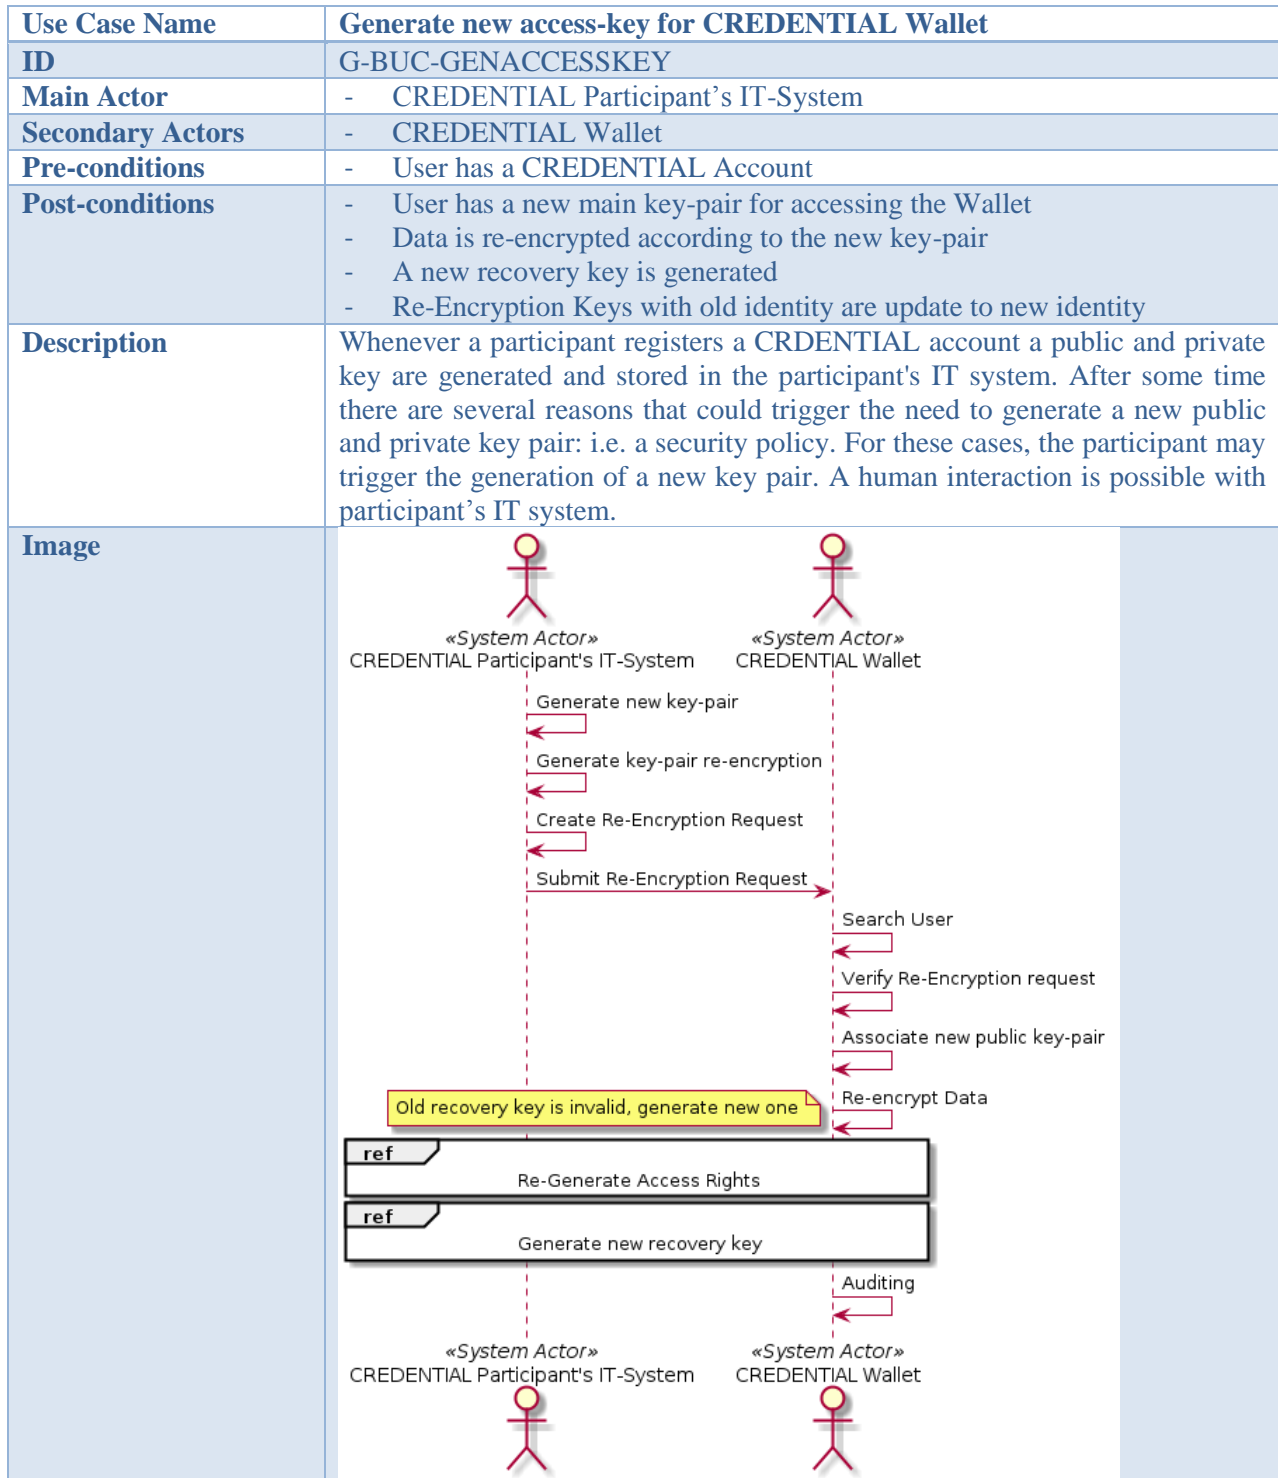

### A.1.4.8 Unlink device from CREDENTIAL Wallet

<b>Use Case Name</b>	<b>Unlink device from CREDENTIAL Wallet</b>
<b>ID</b>	G-BUC-UNLNKDEVICE
<b>Main Actor</b>	- CREDENTIAL Participant
<b>Secondary Actors</b>	- CREDENTIAL Wallet - CREDENTIAL Authorization Service
<b>Pre-conditions</b>	- Device is linked to CREDENTIAL Wallet - Pushing data from the device to the CREDENTIAL Wallet is possible
<b>Post-conditions</b>	- Device is unlinked to the CREDENTIAL Wallet - Pushing data from device to CREDENTIAL Wallet is no longer possible
<b>Description</b>	A participant selects the unlink device functionality in the CREDENTIAL Wallet. The Wallet presents him a list of all associated devices with his account. He selects one device and confirms his decision.
<b>Image</b>	<pre> sequenceDiagram     actor Participant as «Human Actor» Participant     participant Wallet as «System Actor» CREDENTIAL Wallet     participant Service as «System Actor» CREDENTIAL Authorization Service      Participant-&gt;&gt;Wallet: Select unlink device functionality     Participant-&gt;&gt;Wallet: Select device     Wallet-&gt;&gt;Service: Request unlink device     Service--&gt;&gt;Wallet: Unlink device     Service--&gt;&gt;Wallet: Respond successfully unlinked device     </pre>

## A.1.5 Cryptography

### A.1.5.1 Generate new access-key for CREDENTIAL Wallet

### A.1.5.2 Generate new Recovery Key

<b>Use Case Name</b>	<b>Generate new Recovery Key</b>
<b>ID</b>	G-BUC-GENRECKKEY
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Wallet - CREDENTIAL Participant's Cold Storage
<b>Pre-conditions</b>	- Participant has changed his master key in the CREDENTIAL Wallet
<b>Post-conditions</b>	- New Recovery Private Key is stored in cold storage - New Recovery Public Key is stored in CREDENTIAL Wallet - New Recovery Public Key is associated with the participant's identification within the CREDENTIAL Wallet
<b>Description</b>	In order to recover the CREDENTIAL Wallet in case of a lost master key a user has to store a recovery key on a cold storage. If he recovers his old identity, he has to create a new recovery key. In addition a new re-encryption key has to be created from his current identity to the recovery key's identity.
<b>Image</b>	<pre> sequenceDiagram     actor IT as «System Actor» CREDENTIAL Participant's IT-System     actor Cold as «System Actor» CREDENTIAL Participant's cold storage     actor Wallet as «System Actor» CREDENTIAL Wallet     actor Cold2 as «System Actor» CREDENTIAL Participant's cold storage     actor IT2 as «System Actor» CREDENTIAL Participant's IT-System      IT-&gt;&gt;IT: Generate new recovery key     IT-&gt;&gt;IT: Generate recovery re-encryption key     IT-&gt;&gt;Cold: Recovery private key     IT-&gt;&gt;Wallet: New recovery key (recovery public key and recovery re-encryption key)     Wallet-&gt;&gt;Wallet: Search User     Wallet-&gt;&gt;Wallet: Associate recovery public key and recovery re-encryption key     </pre> <p>Re-Encryption Keys from my new identity to another participant have to be provided in this request</p>

### A.1.5.3 Proxy Re-Encryption

<b>Use Case Name</b>	<b>Proxy Re-Encryption</b>
<b>ID</b>	G-BUC-PROXYREENCRIPTION
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Re-Encryption Service - CREDENTIAL Authorization Service
<b>Pre-conditions</b>	- Data set to re-encrypt is available at the CREDENTIAL Wallet - Identifier of data set owner is known to the CREDENTIAL Wallet - Identifier to whom to re-encrypt the data is known - Permission to re-encrypt the data set is available at CREDENTIAL Wallet
<b>Post-conditions</b>	- Data set is re-encrypted in case of Re-Encryption Key is available - Exception is processed in case of Re-Encryption Key is not available
<b>Description</b>	Proxy re-encryption usage is made during the assertion data transmission from several CREDENTIAL network actors (i.e. from IdP to SP).
<b>Image</b>	<pre> sequenceDiagram     actor CW as CREDENTIAL Wallet     actor RES as Re-Encryption Service     actor AS as Authorization Service      CW-&gt;&gt;AS: Request Re-Encryption Key     alt [Re-Encryption Key available]         ref Re-Encrypt Data     else [Re-Encryption Key not available]         Process Exception     end     ref Auditing     </pre>

### A.1.5.4 Remote Signature

<b>Use Case Name</b>	<b>Remote Signature</b>
<b>ID</b>	G-BUC-REMOTESIGNATURE
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Wallet
<b>Pre-conditions</b>	- User has stored his PIN in the wallet
<b>Post-conditions</b>	- PIN is re-encrypted for the Signing Service - Document is signed by the Signing Service
<b>Description</b>	A user requests a signature from a signing service. The signing service creates a signature request and sends it back to the user. The user authenticates himself against the wallet. The user generates a proxy-re-encryption key, provides it in the signature request and sends it to the wallet. The wallet performs an authorization. After a successful authorization the wallet searches the encrypted PIN, re-encrypts it for the signing service and sends it back to the user. The user sends an authentication to the signing service and submits the re-encrypted PIN to the signing service. The signing service can decrypt the PIN using CREDENTIAL technology and signs the document. A human interaction is possible with participant's IT system.
<b>Image</b>	

### A.1.5.5 Selective Disclosure

<b>Use Case Name</b>	<b>Selective Disclosure</b>
<b>ID</b>	G-BUC-SELECTIVEDISCLOSURE
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Identity Provider - Service Provider - CREDENTIAL Sign Service - CREDENTIAL Redactor Service
<b>Pre-conditions</b>	- User has a CREDENTIAL account - Identity Provider is able to issue an Identity Assertion which is redactable
<b>Post-conditions</b>	- User possesses an Identity Assertion with hidden attributes - Identity Assertion signature is valid - Redacted Identity Assertion signature is valid
<b>Description</b>	During an authentication process, user add or delete some data from an assertion released from an IdP, using malleable signatures techniques. The user sends a redact request to the Redactor Service. The Redactor Service responds with the Identity Assertion including the hidden attributes. The user provides this Identity Assertion in his request to the Service Provider. A human interaction is possible with participant's IT system.
<b>Image</b>	<pre> sequenceDiagram     actor IT as CREDENTIAL Participant's IT-System     actor IdP as CREDENTIAL Identity Provider     actor Redactor as CREDENTIAL Redactor Service     actor SP as Service Provider     actor Sign as CREDENTIAL Sign Service      Note over IT, IdP: Authenticate towards CREDENTIAL Wallet     IdP-&gt;&gt;IT: Select Attributes to disclose     IT-&gt;&gt;Redactor: Redact Identity Assertion     Redactor-&gt;&gt;IdP: Provide Identity Assertion     IdP-&gt;&gt;SP: Provide Identity Assertion     SP-&gt;&gt;Sign: Verify Identity Assertion     </pre>

## A.2 Generic Logical Use Cases

### A.2.1 Data Management

#### A.2.1.1 Re-Encrypt Data

Use Case Name	Re-Encrypt Data
<b>ID</b>	G-LUC-REENCDATA
<b>LUC_in</b>	<ul style="list-style-type: none"> <li>- Read Data</li> <li>- Proxy re-encryption</li> <li>- Recover CREDENTIAL Wallet data</li> <li>- Remote Signature</li> <li>- Export data from wallet</li> <li>- Generate new access-key for CREDENTIAL Wallet</li> <li>- Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and a CREDENTIAL-enabled IdP</li> <li>- Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and a IdP</li> <li>- Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and Identity Federation</li> </ul>
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	<ul style="list-style-type: none"> <li>- CREDENTIAL Authorization Service</li> <li>- CREDENTIAL Re-Encryption Service</li> </ul>
<b>Pre-conditions</b>	<ul style="list-style-type: none"> <li>- Target Identifier is available to the wallet</li> <li>- Requester Identifier is available to the wallet</li> <li>- The requested data set is available to the wallet</li> <li>- A Read Access Rule on the specified data set for the requester exists.</li> <li>- A Re-Encryption Key from the Target to the Requester exists.</li> </ul>
<b>Post-conditions</b>	- The Data is re-encrypted for the Requester
<b>Description</b>	The specified data set of the CREDENTIAL Wallet is re-encrypted from the target to the requester. The requester is the participant who wants to receive the data. The target is the participant from which the data set should be re-encrypted.
<b>Image</b>	

### A.2.1.2 Verify Recovery Request

<b>Use Case Name</b>	<b>Verify Recovery Request</b>
<b>ID</b>	G-LUC-VERIFYRECOVERYREQUEST
<b>LUC_in</b>	Recover CREDENTIAL Wallet data
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Authorization Service - Sign Service
<b>Pre-conditions</b>	- Recovery Request is available at the Wallet
<b>Post-conditions</b>	- Recovery Request has been verified
<b>Description</b>	A recovery request has to be verified in order to proceed with the recovery process. A user is only allowed to change the key if the associated recovery key in the request matches a mapping between this id and the user's identification. This is checked by querying the Authorization Service. If this checks succeeds the signature of the request is verified. If the signature is valid and verified the recovery process can continue.
<b>Image</b>	<pre> sequenceDiagram     participant Wallet as «System Actor» CREDENTIAL Wallet     participant Auth as «System Actor» Authorization Service     participant Sign as «System Actor» Sign Service      Note over Wallet: A user is only allowed to recover his password if the provided user identifier matches a mapping to the provided Recovery Key     Wallet-&gt;&gt;Auth: Process Recovery Request     activate Auth     Auth-&gt;&gt;Sign: Verify signature     activate Sign     Sign--&gt;&gt;Auth: [signature verified] Continue Process     deactivate Sign     Auth--&gt;&gt;Wallet: Process Exception     deactivate Auth     </pre>

### A.2.1.3 Read Recovery Private Key

<b>Use Case Name</b>	<b>Read Recovery Private Key</b>
<b>ID</b>	G-LUC-READRECOVERYPRIVKEY
<b>LUC_in</b>	Recover CREDENTIAL Wallet data
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Participant's Cold Storage
<b>Pre-conditions</b>	- Cold Storage available with recovery key on it
<b>Post-conditions</b>	- Recovery Key is available at the CREDENTIAL Participant's IT-System
<b>Description</b>	A participant reads his recovery private key from a cold storage. For example by using a USB stick or scanning a barcode.
<b>Image</b>	

### A.2.1.4 Fill Registration Form

<b>Use Case Name</b>	<b>Fill Registration Form</b>
<b>ID</b>	G-LUC-FILLREGFORM
<b>LUC_in</b>	Export CREDENTIAL Wallet data into form
<b>Main Actor</b>	- Service Provider
<b>Secondary Actors</b>	
<b>Pre-conditions</b>	- The Service Providers received data from the CREDENTIAL Wallet - Data is decrypted
<b>Post-conditions</b>	- The registration form is filled with the CREDENTIAL Wallet data - Registration form is unencrypted
<b>Description</b>	The Service Provider processes the CREDENTIAL Wallet data he receives and fills the data in a registration form.
<b>Image</b>	

### A.2.1.5 Render Registration Form

<b>Use Case Name</b>	<b>Render Registration Form</b>
<b>ID</b>	G-LUC-RENDERREGFORM
<b>LUC_in</b>	Export CREDENTIAL Wallet data into form
<b>Main Actor</b>	- Service Provider
<b>Secondary Actors</b>	- CREDENTIAL Participant's IT-System
<b>Pre-conditions</b>	- Registration Form is enriched with CREDENTIAL data
<b>Post-conditions</b>	- Registration Form is rendered to the User
<b>Description</b>	The registration form to a service provider is rendered to the user.
<b>Image</b>	

### A.2.1.6 Add additional attributes in Registration Form

<b>Use Case Name</b>	<b>Add additional attributes in Registration Form</b>
<b>ID</b>	G-LUC-ADDATTRIBSREGFORM
<b>LUC_in</b>	Export CREDENTIAL Wallet data into form
<b>Main Actor</b>	- CREDENTIAL Participant
<b>Secondary Actors</b>	- CREDENTIAL Participant's IT-System
<b>Pre-conditions</b>	- Registration Form is rendered to the User
<b>Post-conditions</b>	- Registration Form is enriched with user provided attributes
<b>Description</b>	The user adds additional attributes in a registration form.
<b>Image</b>	

### A.2.1.7 Submit Registration Form

<b>Use Case Name</b>	<b>Submit Registration Form</b>
<b>ID</b>	G-LUC-SUBMITREGFORM
<b>LUC_in</b>	Export CREDENTIAL Wallet data into form
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Sign Service - CREDENTIAL Personal Trust Store - Service Provider
<b>Pre-conditions</b>	- User has a CREDENTIAL account
<b>Post-conditions</b>	- Registration Form is sent to the Service Provider - Registration Form is signed by the User
<b>Description</b>	The user submits a registration form filled with CREDENTIAL Wallet data and self-added information to the Service Provider.
<b>Image</b>	<pre> sequenceDiagram     actor IT1 as «System Actor» CREDENTIAL Participant's IT-System     actor IT2 as «System Actor» CREDENTIAL Participant's IT-System     participant CREDENTIAL as CREDENTIAL     actor PTT as «System Actor» Personal Trust Store     actor SS as «System Actor» Sign Service     actor SP as «System Actor» Service Provider      IT1--&gt;&gt;PTT: Read Private Key     PTT-&gt;&gt;SS: Sign Registration Form     SS-&gt;&gt;SP: Send Registration Form     </pre>

### A.2.1.8 Auditing

<b>Use Case Name</b>	<b>Auditing</b>
<b>ID</b>	G-LUC-AUDITING
<b>LUC_in</b>	Request Access Rights
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Audit Trail Service
<b>Pre-conditions</b>	- Active User is known to the wallet
<b>Post-conditions</b>	- For each action an audit entry was created
<b>Description</b>	The CREDENTIAL Wallet performs auditing of every previous action in a specific session performed on the CREDENTIAL Wallet.
<b>Image</b>	<pre> sequenceDiagram     actor CW as «System Actor» CREDENTIAL Wallet     actor ATS as «System Actor» Audit Trail Service     loop [for each action]         CW-&gt;&gt;CW: Identify Active User         CW-&gt;&gt;CW: Identify Action         CW-&gt;&gt;CW: Create Audit Entry         CW-&gt;&gt;ATS: Add Audit Entry     end     </pre>

### A.2.1.9 Receive Data

<b>Use Case Name</b>	<b>Receive Data</b>
<b>ID</b>	G-LUC-RECDATA
<b>LUC_in</b>	Read Data
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant's IT-System
<b>Pre-conditions</b>	
<b>Post-conditions</b>	
<b>Description</b>	The CREDENTIAL Participant's IT-System receives the re-encrypted data from the CREDENTIAL Wallet.
<b>Image</b>	<pre> sequenceDiagram     actor CW as «System Actor» CREDENTIAL Wallet     actor CP as «System Actor» CREDENTIAL Participant's IT-System     CW-&gt;&gt;CP: Send Data     </pre>

### A.2.1.10 Decrypt Data

<b>Use Case Name</b>	<b>Decrypt Data</b>
<b>ID</b>	G-LUC-DECDATA
<b>LUC_in</b>	<ul style="list-style-type: none"> <li>- Read Data</li> <li>- Export data from wallet</li> </ul>
<b>Main Actor</b>	- Service Provider
<b>Secondary Actors</b>	<ul style="list-style-type: none"> <li>- CREDENTIAL Personal Trust Store</li> <li>- CREDENTIAL Decryption Service</li> </ul>
<b>Pre-conditions</b>	<ul style="list-style-type: none"> <li>- The Service Provider has a CREDENTIAL Account</li> <li>- The data is decrypted for the Participant</li> <li>- The data is encrypted with a proxy-re-encryption schema</li> </ul>
<b>Post-conditions</b>	- The Service Provider can read the data
<b>Description</b>	The CREDENTIAL Participant's IT-System decrypts the data using CREDENTIAL technologies.
<b>Image</b>	<pre> sequenceDiagram     actor SP as «System Actor» Service Provider     participant CREDENTIAL as CREDENTIAL     participant PTS as «System Actor» Personal Trust Store     participant DS as «System Actor» Decryption Service      SP-&gt;&gt;PTS: Parse Data Set     PTS-&gt;&gt;DS: Read Private Key     loop [For Each Encrypted Data Entry]         DS-&gt;&gt;SP: Decrypt Data Entry     end     </pre>

### A.2.1.11 Encrypt Data using CREDENTIAL

<b>Use Case Name</b>	<b>Encrypt Data using CREDENTIAL</b>
<b>ID</b>	G-LUC-ENCADATAACREDENTIAL
<b>LUC_in</b>	<ul style="list-style-type: none"> <li>- Send Data</li> <li>- Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and a IdP</li> </ul>
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	<ul style="list-style-type: none"> <li>- CREDENTIAL Encryption Service</li> <li>- CREDENTIAL Personal Trust Store</li> <li>- CREDENTIAL Participant Search Service</li> </ul>
<b>Pre-conditions</b>	<ul style="list-style-type: none"> <li>- Participant has a CREDENTIAL Account</li> <li>- Participant can identify the data owner</li> </ul>
<b>Post-conditions</b>	- Data is encrypted for the data owner
<b>Description</b>	<p>A CREDENTIAL Participant encrypts data on his IT-System using CREDENTIAL technology.</p> <p>E.g. encrypting medical data using proxy-re-encryption-enabled cryptographic key material and algorithms.</p>
<b>Image</b>	<pre> sequenceDiagram     actor IT as «System Actor» CREDENTIAL Participant's IT-System     actor PTT as «System Actor» Personal Trust Store     actor ES as «System Actor» Encryption Service     actor PSS as «System Actor» Participant Search Service      alt [Participant is data owner]         IT-&gt;&gt;PTT: Read Public Key     else [Participant is not data owner]         IT-&gt;&gt;PSS: Search Receiver's CREDENTIAL Information         PSS-&gt;&gt;IT: Read Public Key from Receiver's CREDENTIAL Information     end     IT-&gt;&gt;ES: Encrypt Data     </pre>

### A.2.1.12 Send Encrypted Data

<b>Use Case Name</b>	<b>Send Encrypted Data</b>
<b>ID</b>	G-LUC-SENDENCDATA
<b>LUC_in</b>	<ul style="list-style-type: none"> <li>- Send Data</li> <li>- Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and a CREDENTIAL-enabled IdP</li> <li>- Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and a IdP</li> <li>- Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and Identity Federation</li> </ul>
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	<ul style="list-style-type: none"> <li>- CREDENTIAL Wallet</li> <li>- CREDENTIAL Personal Trust Store</li> <li>- CREDENTIAL Sign Service</li> </ul>
<b>Pre-conditions</b>	<ul style="list-style-type: none"> <li>- Data is encrypted</li> <li>- Receiver's Information is available</li> <li>- Provider's Information is available</li> <li>- Provider has a CREDENTIAL account</li> </ul>
<b>Post-conditions</b>	- Send Data Request is available at the wallet
<b>Description</b>	A CREDENTIAL Participant sends encrypted data to the CREDENTIAL Wallet.
<b>Image</b>	<pre> sequenceDiagram     actor Actor as «System Actor» CREDENTIAL Participant's IT-System     participant Actor as «System Actor» CREDENTIAL Personal Trust Store     participant Actor as «System Actor» CREDENTIAL Sign Service     participant Actor as «System Actor» CREDENTIAL Wallet      Actor-&gt;&gt;Actor: Create Send Data Request     Actor-&gt;&gt;Actor: Add Receiver Information     Actor-&gt;&gt;Actor: Add Provider Information     Actor-&gt;&gt;Actor: Add Encrypted Data     Actor-&gt;&gt;Actor: Read Private Key     Actor-&gt;&gt;Actor: Sign Send Data Request     Actor-&gt;&gt;Actor: Submit Send Data Request     </pre> <p>The diagram illustrates the process of sending encrypted data. It involves four main components: the CREDENTIAL Participant's IT-System, the CREDENTIAL Personal Trust Store, the CREDENTIAL Sign Service, and the CREDENTIAL Wallet. The IT-System initiates the process by creating a send data request, adding receiver and provider information, and adding encrypted data. It then reads a private key from the Personal Trust Store, signs the request using the Sign Service, and finally submits the signed request to the CREDENTIAL Wallet. Two yellow callouts highlight that the IT-System is both the participant who receives the data in the wallet and the participant who provides the data.</p>

### A.2.1.13 Register Data

<b>Use Case Name</b>	<b>Register Data</b>
<b>ID</b>	G-LUC-REGDATA
<b>LUC_in</b>	Send Data
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant Data Repository - CREDENTIAL Participant Search Service
<b>Pre-conditions</b>	- Data is encrypted for the user
<b>Post-conditions</b>	- Data is stored for the user in the CREDENTIAL Wallet.
<b>Description</b>	The CREDENTIAL Wallet registers data for a CREDENTIAL user in his data store.
<b>Image</b>	<pre> sequenceDiagram     actor Wallet as «System Actor» CREDENTIAL Wallet     actor DataStore as «System Actor» Participant Data Store     actor SearchService as «System Actor» Participant Search Service      Wallet-&gt;&gt;SearchService: Search Participant's Information     SearchService-&gt;&gt;DataStore: Store Data for Participant     </pre>

### A.2.1.14 Define Request Parameters

<b>Use Case Name</b>	<b>Define Request Parameters</b>
<b>ID</b>	G-LUC-DEFREQPARAMS
<b>LUC_in</b>	Read Data
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Personal Trust Store - CREDENTIAL Sign Service - CREDENTIAL Participant Search Service
<b>Pre-conditions</b>	- Participant from whom the data should be read is known - Requester has a CREDENTIAL Account - Requester has Read Access Rights on the specified data set
<b>Post-conditions</b>	- Request Parameters are created
<b>Description</b>	A CREDENTIAL Participant defines with his IT-System Request Parameters in order to retrieve Data from the Wallet.
<b>Image</b>	

### A.2.1.15 Request Data

<b>Use Case Name</b>	<b>Request Data</b>
<b>ID</b>	G-LUC-REQDATA
<b>LUC_in</b>	Read Data
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Wallet
<b>Pre-conditions</b>	- Request Parameters have been defined
<b>Post-conditions</b>	- Request Parameters are sent to the wallet
<b>Description</b>	A CREDENTIAL Participant's IT-System requests data from the Wallet.
<b>Image</b>	

### A.2.1.16 Search Data

<b>Use Case Name</b>	<b>Search Data</b>
<b>ID</b>	G-LUC-SEARCHDATA
<b>LUC_in</b>	- Read Data - Remote Signature - Export data from wallet
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant Data Search Service
<b>Pre-conditions</b>	- Request Parameters are available to the CREDENTIAL Wallet
<b>Post-conditions</b>	- Data specified in the Request Parameters have been read from the Data Search Service
<b>Description</b>	The CREDENTIAL Wallet searches for the requested data specified by the given request parameters.
<b>Image</b>	

### A.2.1.17 Request Signature

<b>Use Case Name</b>	<b>Request Signature</b>
<b>ID</b>	G-LUC-REQSIGN
<b>LUC_in</b>	Remote Signature
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Personal Trust Store - CREDENTIAL Sign Service - External Signature Service
<b>Pre-conditions</b>	- The Participant has a CREDENTIAL account - The External Signature Service has a CREDENTIAL account
<b>Post-conditions</b>	- The Signature Request is available at the External Signature Service
<b>Description</b>	A CREDENTIAL Participant requests a signature from an external signing service.
<b>Image</b>	<pre> sequenceDiagram     actor IT as «System Actor» CREDENTIAL Participant's IT-System     actor ESS as «System Actor» External Signature Service     actor PTT as «System Actor» Personal Trust Store     actor SS as «System Actor» Signature Service      IT-&gt;&gt;IT: Create Signature Request     IT-&gt;&gt;IT: Provide Document to Sign in Signature Request     IT-&gt;&gt;IT: Provide CREDENTIAL Participant Information in Signature Request     IT-&gt;&gt;IT: Read Private Key     IT-&gt;&gt;SS: Sign Signature Request     IT-&gt;&gt;ESS: Send Signature Request     </pre>

### A.2.1.18 Create Signature Request

<b>Use Case Name</b>	<b>Create Signature Request</b>
<b>ID</b>	G-LUC-CREATESIGNREQ
<b>LUC_in</b>	Remote Signature
<b>Main Actor</b>	- External Signature Service
<b>Secondary Actors</b>	- CREDENTIAL Personal Trust Store - CREDENTIAL Sign Service
<b>Pre-conditions</b>	- The External Signing Service has a CREDENTIAL Account - The external Signing Service has received a Signature Request
<b>Post-conditions</b>	- The Signature Request is enriched with the External Signing Service Public Key - The Signature Request is signed by the External Signing Service
<b>Description</b>	A Signing Service creates a Signature Request including his CREDENTIAL Identifier and Public Key.
<b>Image</b>	<pre> sequenceDiagram     actor External as «System Actor» External Signature Service     participant CREDENTIAL as CREDENTIAL     actor Personal as «System Actor» Personal Trust Store     actor Sign as «System Actor» Sign Service      External-&gt;&gt;Personal: Read Public Key     Personal--&gt;&gt;External:      External-&gt;&gt;Personal: Add Public Key to Signature Request     Personal--&gt;&gt;External:      External-&gt;&gt;Sign: Sign Signature Request     </pre>

### A.2.1.19 Provide Signature Request

<b>Use Case Name</b>	<b>Provide Signature Request</b>
<b>ID</b>	G-LUC-PROVSIGNREQ
<b>LUC_in</b>	Remote Signature
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Personal Trust Store - CREDENTIAL Sign Service - CREDENTIAL Re-Encryption Key Generation Service
<b>Pre-conditions</b>	- Signature Request from the external Signing Service is available at the Participant's IT-System
<b>Post-conditions</b>	- Signature Request is signed by the CREDENTIAL Participant
<b>Description</b>	A CREDENTIAL Participant provides via his IT-System a signature request to the CREDENTIAL Wallet. He creates a Re-Encryption Key based on the Information given in the Signature Request by the Signing Service.
<b>Image</b>	<pre> sequenceDiagram     actor Actor as «System Actor» CREDENTIAL Participant's IT-System     participant Actor as «System Actor» CREDENTIAL Participant's IT-System     participant Actor as «System Actor» CREDENTIAL Personal Trust Store     participant Actor as «System Actor» CREDENTIAL Sign Service     participant Actor as «System Actor» CREDENTIAL Proxy-Re-Encryption Key Generation Service     participant Actor as «System Actor» CREDENTIAL Wallet      Actor-&gt;&gt;Actor: Read Service Providers Public Key from Signature Request     Actor-&gt;&gt;Actor: Read Private Key     Actor-&gt;&gt;Actor: Create Proxy-Re-Encryption Key     Actor-&gt;&gt;Actor: Add Proxy-Re-Encryption Key to Signature Request     Actor-&gt;&gt;Actor: Sign Signature Request     Actor-&gt;&gt;Actor: Send Signature Request     </pre> <p>The diagram illustrates the process of providing a signature request. It involves the CREDENTIAL Participant's IT-System (System Actor) interacting with several CREDENTIAL components: Personal Trust Store, Sign Service, Proxy-Re-Encryption Key Generation Service, and CREDENTIAL Wallet. The process starts with the IT-System reading a service provider's public key and a private key from a signature request. It then creates a proxy-re-encryption key and adds it to the signature request. Finally, the IT-System signs the signature request and sends it to the CREDENTIAL Wallet.</p>

### A.2.1.20 Provide Data in Signature Request

<b>Use Case Name</b>	<b>Provide Data in Signature Request</b>
<b>ID</b>	G-LUC-PROVDATASIGNREQ
<b>LUC_in</b>	Remote Signature
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant Data Search Service - CREDENTIAL Re-Encryption Service
<b>Pre-conditions</b>	- Signature Request is available at the wallet
<b>Post-conditions</b>	- Signature Request is enriched with re-encrypted PIN
<b>Description</b>	The CREDENTIAL Wallet provides the re-encrypted data, e.g. the PIN, in the signature request.
<b>Image</b>	

### A.2.1.21 Receive Signature Request

<b>Use Case Name</b>	<b>Receive Signature Request</b>
<b>ID</b>	G-LUC-RECSIGNREQ
<b>LUC_in</b>	Remote Signature
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant's IT-System
<b>Pre-conditions</b>	
<b>Post-conditions</b>	
<b>Description</b>	The CREDENTIAL Participant receives the signature request with the enriched re-encrypted data, e.g. the PIN.
<b>Image</b>	

### A.2.1.22 Sign Document

<b>Use Case Name</b>	<b>Sign Document</b>
<b>ID</b>	G-LUC-SIGNDOC
<b>LUC_in</b>	Remote Signature
<b>Main Actor</b>	- External Signature Service
<b>Secondary Actors</b>	- CREDENTIAL Decryption Service - CREDENTIAL Personal Trust Store
<b>Pre-conditions</b>	- Signature Request with Re-Encrypted PIN is available
<b>Post-conditions</b>	- Document is signed - PIN was verified by the external Signature Service
<b>Description</b>	The Signing Services signs the specified document.
<b>Image</b>	<pre> sequenceDiagram     actor External as «System Actor» External Signature Service     participant CREDENTIAL as CREDENTIAL     actor Personal as «System Actor» Personal Trust Store     actor Decryption as «System Actor» Decryption Service      External-&gt;&gt;CREDENTIAL: Process Signature Request     activate CREDENTIAL     CREDENTIAL-&gt;&gt;Personal: Read Re-Encrypted PIN     deactivate Personal     Personal-&gt;&gt;External: Read Private Key     deactivate Personal     External-&gt;&gt;Decryption: Decrypt PIN     activate Decryption     Decryption-&gt;&gt;External: Verify PIN     deactivate Decryption     External-&gt;&gt;External: Sign Document     deactivate CREDENTIAL     </pre>

### A.2.1.23 Receive Signed Document

<b>Use Case Name</b>	<b>Receive Signed Document</b>
<b>ID</b>	G-LUC-RECSIGNDOC
<b>LUC_in</b>	Remote Signature
<b>Main Actor</b>	- External Signature Service
<b>Secondary Actors</b>	- CREDENTIAL Participant's IT-System
<b>Pre-conditions</b>	- Participant initiated signature of a document - External Signature Service computed signature over document
<b>Post-conditions</b>	- Signed document is available at the Participant's IT-System
<b>Description</b>	The CREDENTIAL Participant's IT-System receives the signed document from the signature service.
<b>Image</b>	

### A.2.1.24 Recognize Externally triggered Event

<b>Use Case Name</b>	<b>Recognize Externally triggered Event</b>
<b>ID</b>	G-LUC-RECEXTTRIGEVENT
<b>LUC_in</b>	Send Notification
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	
<b>Pre-conditions</b>	- Event occurred in the CREDENTIAL Wallet
<b>Post-conditions</b>	- Event is recognized for the Notification process flow
<b>Description</b>	The CREDENTIAL Wallet recognizes an externally triggered event. E.g. reading of data, writing of data, granting access rights ...
<b>Image</b>	

### A.2.1.25 Evaluate Notification Configuration

<b>Use Case Name</b>	<b>Evaluate Notification Configuration</b>
<b>ID</b>	G-LUC-EVALNOTIFYCONF
<b>LUC_in</b>	Send Notification
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	
<b>Pre-conditions</b>	- An event occurred in the CREDENTIAL Wallet
<b>Post-conditions</b>	- The List of participants who needs to receive a notification are known
<b>Description</b>	The CREDENTIAL Wallet evaluates the notification configuration if the triggered event might trigger one or multiple notifications.
<b>Image</b>	<pre> sequenceDiagram     actor Actor1 as «System Actor» CREDENTIAL Wallet     actor Actor2 as «System Actor» CREDENTIAL Wallet     Actor1--&gt;&gt;Actor2: Identify Participants     </pre>

### A.2.1.26 Create Notification List

<b>Use Case Name</b>	<b>Create Notification List</b>
<b>ID</b>	G-LUC-CREATENOTIFYLIST
<b>LUC_in</b>	Send Notification
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant Search Service
<b>Pre-conditions</b>	- Participant who receives a notification are known
<b>Post-conditions</b>	- List of notifications is created - Addresses of recipient is contained in notification list
<b>Description</b>	The CREDENTIAL Wallet creates a notification list containing the recipients who will receive a notification triggered by an event.
<b>Image</b>	<p>The diagram illustrates the 'Create Notification List' use case. It features three system actors: CREDENTIAL Wallet, CREDENTIAL Participant Search Service, and CREDENTIAL Participant Index. A loop frame labeled '[participants]' is shown, containing a 'ref' frame for 'Search User'. Within this loop, the CREDENTIAL Wallet actor sends two messages to itself: 'Identify address' and 'Add notification entry'.</p>

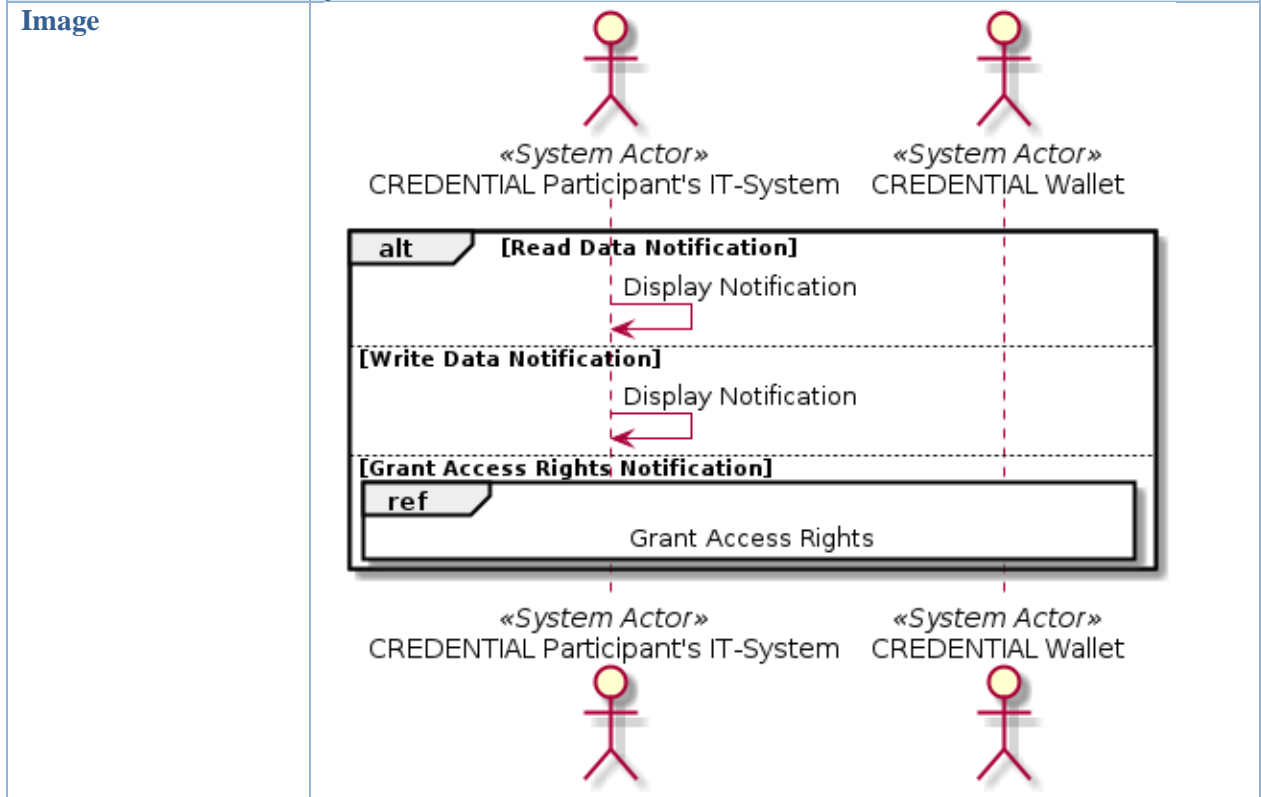

### A.2.1.27 Send Notification

<b>Use Case Name</b>	<b>Send Notification</b>
<b>ID</b>	G-LUC-SENDNOTIFY
<b>LUC_in</b>	<ul style="list-style-type: none"> <li>- Send Notification</li> <li>- Link Service Provider account with CREDENTIAL account</li> </ul>
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant's IT-System
<b>Pre-conditions</b>	<ul style="list-style-type: none"> <li>- Notification occurred in the CREDENTIAL Wallet about particular event</li> <li>- Participant needs to be informed about event</li> <li>- Participant's IT-System address is known</li> </ul>
<b>Post-conditions</b>	- Notification is available at the Participant's IT-System
<b>Description</b>	The CREDENTIAL Wallet sends a notification about an event to a CREDENTIAL Participant's IT-System.
<b>Image</b>	<pre> sequenceDiagram     actor Actor1 as «System Actor» CREDENTIAL Participant's IT-System     actor Actor2 as «System Actor» CREDENTIAL Wallet     Actor2-&gt;&gt;Actor1: Send Notification     </pre>

**A.2.1.28 Process Notification**

<b>Use Case Name</b>	<b>Process Notification</b>
<b>ID</b>	G-LUC-PROCNOTIFY
<b>LUC_in</b>	Send Notification
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant's IT-System
<b>Pre-conditions</b>	- Notification available at the IT-System
<b>Post-conditions</b>	- Further process flows have been triggered
<b>Description</b>	The CREDENTIAL Participant's IT-System processes a notification. A notification is generic and can be information about reading of data, writing of data or requesting of access rights. The participant's IT-System has to detect the kind of notification and trigger the further process flows. This logical use case triggers other business use cases. Human interaction may be possible.

### A.2.1.29 Create Delete Data Request

<b>Use Case Name</b>	<b>Create Delete Data Request</b>
<b>ID</b>	G-LUC-CREATEDELDATAREQ
<b>LUC_in</b>	Delete data set
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	
<b>Pre-conditions</b>	- Participant's Identifier is known
<b>Post-conditions</b>	- Delete Data Request is created
<b>Description</b>	The CREDENTIAL Participant's IT-System creates a delete data request.
<b>Image</b>	

### A.2.1.30 Submit Delete Data Request

<b>Use Case Name</b>	<b>Submit Delete Data Request</b>
<b>ID</b>	G-LUC-SUBMITDELDATAREQ
<b>LUC_in</b>	Delete data set
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Wallet
<b>Pre-conditions</b>	- Participant has created a Delete Data Request
<b>Post-conditions</b>	- Delete Data Request is available at the CREDENTIAL Wallet
<b>Description</b>	The CREDENTIAL Participant's IT-System sends the delete data request to the CREDENTIAL Wallet.
<b>Image</b>	

### A.2.1.31 Delete Data

<b>Use Case Name</b>	<b>Delete Data</b>
<b>ID</b>	G-LUC-DELDATA
<b>LUC_in</b>	Delete data set
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant Data Search Service - CREDENTIAL Data Repository Provider
<b>Pre-conditions</b>	- Participant's Identifier is known - Data set to delete is known - Participant is allowed to delete data set
<b>Post-conditions</b>	- Data set is deleted.
<b>Description</b>	The CREDENTIAL Wallet deletes the specified data. The identifier of the data is searched through the Data Search Service. With the identifier the delete operation at the Data Repository is triggered.
<b>Image</b>	

### A.2.1.32 Encrypt Data

<b>Use Case Name</b>	<b>Encrypt Data</b>
<b>ID</b>	G-LUC-ENCDATA
<b>LUC_in</b>	
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Authorization Service - CREDENTIAL Encryption Service
<b>Pre-conditions</b>	- Target Identifier is available to the CREDENTIAL - Requester Identifier is available to the CREDENTIAL - The requested data set is available to the CREDENTIAL - A Read Access Rule on the specified data set for the requester exists. - A Re-Encryption Key from the Target to the Requester exists.
<b>Post-conditions</b>	- The Data is encrypted for the Requester
<b>Description</b>	The specified data set of the CREDENTIAL Wallet is encrypted from the target to the requester. The requester is the participant who wants to receive the data. The target is the participant from which the data set should be encrypted.
<b>Image</b>	<p>The diagram is a UML Use Case diagram titled "CREDENTIAL Wallet". It shows three system actors: «System Actor» CREDENTIAL Wallet, «System Actor» Authorization Service, and «System Actor» Encryption Service. The interactions are as follows:</p> <ul style="list-style-type: none"> <li>The CREDENTIAL Wallet actor performs three self-interactions: "Identify Requesters CREDENTIAL ID", "Identify Targets CREDENTIAL ID", and "Identify Requested Data".</li> <li>The CREDENTIAL Wallet actor sends a "Read Encryption Key" message to the Authorization Service actor.</li> <li>A loop box labeled "loop [for each data entry]" encloses the following interaction:             <ul style="list-style-type: none"> <li>The CREDENTIAL Wallet actor sends an "Encrypt Participant's Data" message to the Encryption Service actor.</li> </ul> </li> </ul>

### A.2.1.33 Request Re-Encryption Key

<b>Use Case Name</b>	<b>Request Re-Encryption Key</b>
<b>ID</b>	G-LUC-REQREK
<b>LUC_in</b>	Proxy Re-Encryption
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant Index - CREDENTIAL Authorization Service
<b>Pre-conditions</b>	- Information about participant's to find there identifier is available at the CREDENTIAL Wallet
<b>Post-conditions</b>	- Re-Encryption Key is available at the CREDENTIAL Wallet
<b>Description</b>	In order to process a proxy-re-encryption the CREDENTIAL Wallet needs a Proxy-Re-Encryption Key. Usually a Proxy-Re-Encryption Key is associated with a participant from whom data is encrypted and a participant to whom the data will be re-encrypted. With this information a CREDENTIAL Wallet is able to receive a re-encryption key from the Authorization Service.
<b>Image</b>	<pre> sequenceDiagram     actor Wallet as «System Actor» CREDENTIAL Wallet     actor Index as «System Actor» CREDENTIAL Participant Index     actor Auth as «System Actor» CREDENTIAL Authorization Service      Note over Wallet: Participant from whom the data is encrypted and participant to whom the data should be re-encrypted     Wallet-&gt;&gt;Index: Request Participant Identifier     Index-&gt;&gt;Auth: Request Re-Encryption Key     Auth-&gt;&gt;Auth: Search Re-Encryption Key     Auth--&gt;&gt;Index: Return Re-Encryption Key     Index--&gt;&gt;Wallet: Return Re-Encryption Key     </pre> <p>The diagram illustrates the process of requesting a re-encryption key. It involves three system actors: the CREDENTIAL Wallet, the CREDENTIAL Participant Index, and the CREDENTIAL Authorization Service. The process starts with the Wallet requesting a participant identifier from the Index. The Index then requests a re-encryption key from the Authorization Service. The Authorization Service performs a search for the key and returns it to the Index, which then returns it to the Wallet.</p>

### A.2.1.34 Process Exception

<b>Use Case Name</b>	<b>Process Exception</b>
<b>ID</b>	G-LUC-PROCEXC
<b>LUC_in</b>	Proxy Re-Encryption
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	
<b>Pre-conditions</b>	- An exception occurs - Originator of the most recent request is known
<b>Post-conditions</b>	- Exception has been propagated to the most recent request originator
<b>Description</b>	If an exception occurs in a use case the CREDENTIAL Wallet has to provide an exception with enough information to the most recent originator of a request to the CREDENTIAL Wallet. For example, a user wants to request data but is not allowed to read the data. Then an exception has to be propagated to the user.
<b>Image</b>	<pre> sequenceDiagram     actor Actor1 as CREDENTIAL Wallet     actor Actor2 as CREDENTIAL Wallet     Actor1--&gt;&gt;Actor2: Create Exception     Actor2--&gt;&gt;Left: Propagate Exception     </pre>

## A.2.2 Authentication

### A.2.2.1 Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and a CREDENTIAL-enabled IdP

<b>Use Case Name</b>	<b>Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and a CREDENTIAL-enabled IdP</b>
<b>ID</b>	G-LUC-AUTHSPUSINGWALLETENABLEDIDP
<b>Main Actor</b>	- CREDENTIAL Participant
<b>Secondary Actors</b>	- CREDENTIAL Attribute Service - CREDENTIAL Identity Provider - Service Provider - CREDENTIAL Proxy Re-Encryption Service
<b>Pre-conditions</b>	- A Re-Encryption Key from the User to the Service Provider is available in the CREDENTIAL Wallet or will be generated during the process flow - The SP established a trust relation with the IdP - A list of trusted IdPs is defined
<b>Post-conditions</b>	- Attributes are disclosed to the Service Provider - User is authenticated to the Service Provider
<b>Description</b>	A user authenticates himself against a Service Provider which supports CREDENTIAL technology. He uses a CREDENTIAL-enabled IdP. The attributes inside his Identity Assertion are re-encrypted by the IdP for the CREDENTIAL SP. The attributes are read from the CREDENTIAL Wallet.
<b>Image</b>	<pre> sequenceDiagram     actor User as «Human Actor» User     participant AS as «System Actor» AttributeService     participant IdP as «System Actor» CREDENTIAL-enabled IdP     participant SP as «System Actor» CREDENTIAL SP     participant CREDENTIAL as «System Actor» ProxyreencryptionModule      User-&gt;&gt;AS: Select CREDENTIAL Identity Provider     AS-&gt;&gt;IdP: Authentication     IdP-&gt;&gt;IdP: Analyse user's credentials     alt [successful case Credentials are valid]         IdP-&gt;&gt;AS: Asks for attributes         AS-&gt;&gt;IdP: Provides attributes         IdP-&gt;&gt;CREDENTIAL: Request Proxy re-encryption keys         CREDENTIAL-&gt;&gt;IdP: Re-encrypts data using CREDENTIAL         IdP-&gt;&gt;SP: Releases an assertion         SP-&gt;&gt;CREDENTIAL: Decryption of needed data using CREDENTIAL     else [invalid certificate]         IdP--&gt;&gt;User: access denied     end     IdP-&gt;&gt;User: Provides access     </pre>

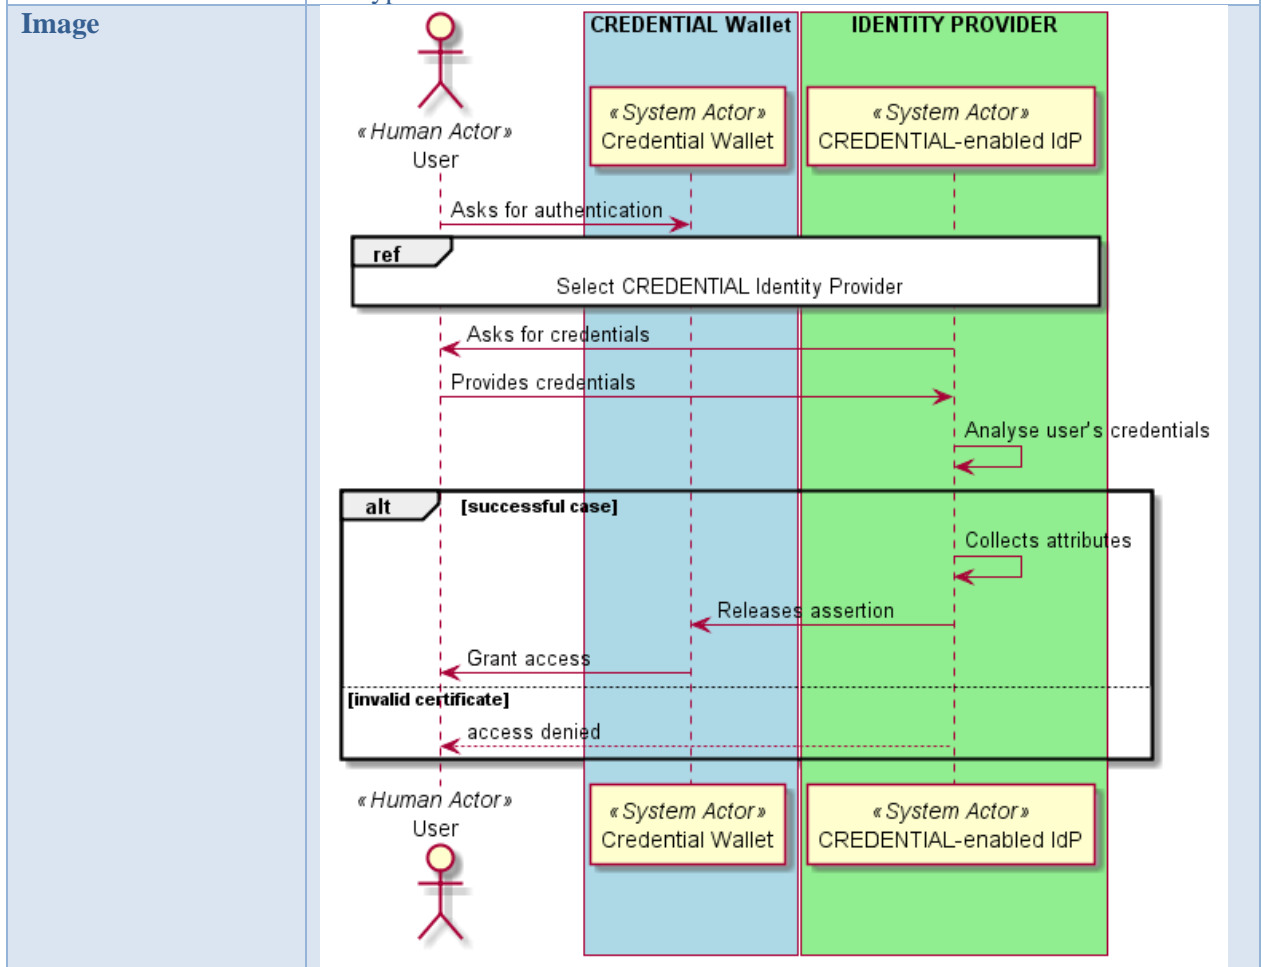

**A.2.2.2 Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and a IdP**

<b>Use Case Name</b>	<b>Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and a IdP</b>
<b>ID</b>	G-LUC-AUTHSPUSINGWALLETIDP
<b>Main Actor</b>	- CREDENTIAL Participant
<b>Secondary Actors</b>	- CREDENTIAL Attribute Service - Service Provider - CREDENTIAL Proxy Re-Encryption Service - IdP Selector - Identity Provider
<b>Pre-conditions</b>	- A Re-Encryption Key from the User to the Service Provider is available in the CREDENTIAL Wallet or will be generated during the process flow. - SP establish a trust relation to the IdP. - A list of trusted IdPs is needed.
<b>Post-conditions</b>	- Attributes are disclosed for the Service Provider - User is authenticated to the Service Provider
<b>Description</b>	A user authenticates himself against a Service Provider which supports CREDENTIAL technology. He uses a normal IdP. The attributes are read from the CREDENTIAL Wallet.
<b>Image</b>	<pre> sequenceDiagram     actor User as «Human Actor» User     participant AS as «System Actor» AttributeService     participant CSP as «System Actor» CREDENTIAL Service Provider     participant IDP as «System Actor» Identity Provider     participant PReEM as «System Actor» ProxyreencryptionModule      User-&gt;&gt;AS: Authentication     AS-&gt;&gt;IDP: Analyze users credentials     IDP-&gt;&gt;AS:      AS-&gt;&gt;User: Provides attributes     AS-&gt;&gt;AS: Encrypts attributes     AS-&gt;&gt;User: Send Data     AS-&gt;&gt;CSP: Request Proxy re-encryption keys     CSP-&gt;&gt;AS: Re-encrypts data using CREDENTIAL     CSP-&gt;&gt;IDP: Release assertion     IDP-&gt;&gt;CSP: Decryption of needed data using CREDENTIAL     CSP-&gt;&gt;AS: Provides access     AS-&gt;&gt;User: access denied      alt [invalid user's credentials]         AS-&gt;&gt;User: access denied     else [successful case]         AS-&gt;&gt;User: Provides attributes         AS-&gt;&gt;AS: Encrypts attributes         AS-&gt;&gt;User: Send Data         AS-&gt;&gt;CSP: Request Proxy re-encryption keys         CSP-&gt;&gt;AS: Re-encrypts data using CREDENTIAL         CSP-&gt;&gt;IDP: Release assertion         IDP-&gt;&gt;CSP: Decryption of needed data using CREDENTIAL         CSP-&gt;&gt;AS: Provides access         AS-&gt;&gt;User: access denied     end     </pre>

### A.2.2.3 Authenticate towards CREDENTIAL Wallet using CREDENTIAL-enabled IdP

<b>Use Case Name</b>	<b>Authenticate towards CREDENTIAL Wallet using CREDENTIAL-enabled IdP</b>
<b>ID</b>	G-LUC-AUTHWALLETUSINGENABLEDIDP
<b>Main Actor</b>	- CREDENTIAL Participant
<b>Secondary Actors</b>	- CREDENTIAL Proxy Re-Encryption Service - CREDENTIAL Identity Provider
<b>Pre-conditions</b>	- CREDENTIAL Wallet establish a trust relation to the IdP - A list of Trusted IdPs is available
<b>Post-conditions</b>	- User is authenticated to CREDENTIAL Wallet
<b>Description</b>	A user authenticates towards the CREDENTIAL Wallet. He uses a CREDENTIAL-enabled IdP. The attributes inside the assertion are re-encrypted from the IdP to the CREDENTIAL Wallet.

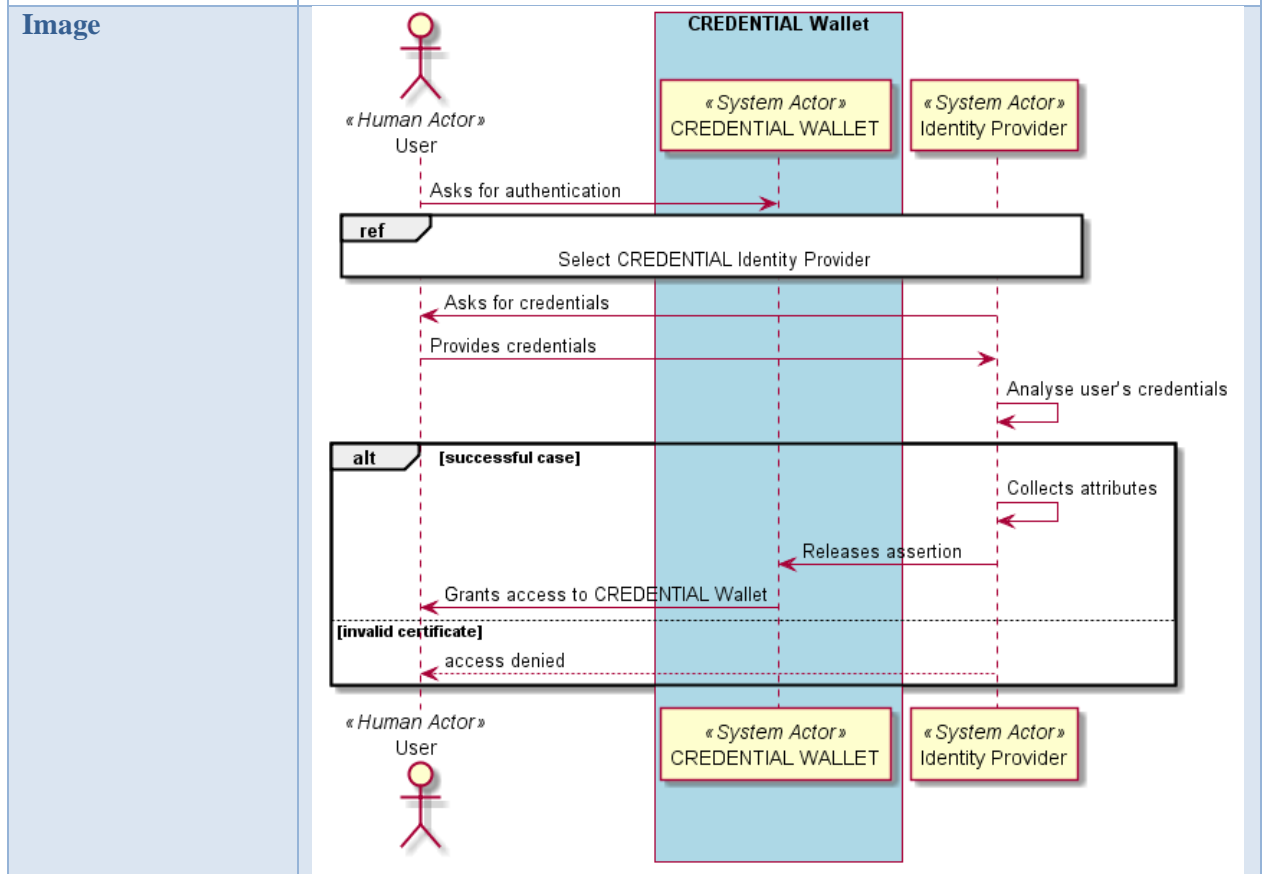

### A.2.2.4 Authenticate towards CREDENTIAL Wallet using an external IdP

<b>Use Case Name</b>	<b>Authenticate towards CREDENTIAL Wallet using an external IdP</b>
<b>ID</b>	G-LUC-AUTHWALLETUSINGEXTERNALIDP
<b>Main Actor</b>	- CREDENTIAL Participant
<b>Secondary Actors</b>	- CREDENTIAL Attribute Service - CREDENTIAL Wallet
<b>Pre-conditions</b>	- CREDENTIAL Wallet establish a trust relation to the IdP - A list of Trusted IdPs is needed - The user has linked the external account with his CREDENTIAL account.
<b>Post-conditions</b>	- User is authenticated to CREDENTIAL Wallet
<b>Description</b>	A user authenticates towards the CREDENTIAL Wallet. He uses an external IdP. The CREDENTIAL Wallet authenticates the user if he has linked the external account with his CREDENTIAL account.

### A.2.2.5 Select CREDENTIAL Identity Provider

<b>Use Case Name</b>	<b>Select CREDENTIAL Identity Provider</b>
<b>ID</b>	G-LUC-SELECTCREDIDP
<b>Main Actor</b>	- CREDENTIAL Participant
<b>Secondary Actors</b>	- CREDENTIAL Identity Provider - IdP Selector - Service Provider
<b>Pre-conditions</b>	- SP establish a trust relation to the IdPs - The SP establish a trust relation to CREDENTIAL Wallet - The user has to be registered in an IdP
<b>Post-conditions</b>	- The user is redirected to the selected IdP
<b>Description</b>	A User tries to get access to a protected resource. The SP asks the IdP Selector for a list of available IdPs. The IdP Selector provides a list of IdPs to the user. The user selects an IdP from the list and the IdP Selector redirects the user to the selected IdP.
<b>Image</b>	<pre> sequenceDiagram     actor User as «Human Actor» User     participant SP as «System Actor» SP     participant IdPSelector as «System Actor» IdP Selector     participant CREDIDP as «System Actor» CREDENTIAL Idp      User-&gt;&gt;SP: Requests for access to a protected resource     SP-&gt;&gt;IdPSelector: Asks for a list of IdPs     IdPSelector--&gt;&gt;User: Asks to select an IdP from the provided list     User-&gt;&gt;IdPSelector: Selects and IdP     IdPSelector-&gt;&gt;CREDIDP: IdP Selector redirects the user to the selected IdP     </pre>

### A.2.2.6 Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and Identity Federation

<b>Use Case Name</b>	<b>Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and Identity Federation</b>
<b>ID</b>	G-LUC-AUTHSPUSINGWALLETANDIDENTITYFEDERATION
<b>Main Actor</b>	- CREDENTIAL Participant
<b>Secondary Actors</b>	- CREDENTIAL Wallet - Service Provider - eID-System - STORK module - STORK IdP - CREDENTIAL Proxy Re-Encryption Service - CREDENTIAL Identity Provider
<b>Pre-conditions</b>	- SP establish a trust relation to Federated IdP - User is registered in a Federated IdP
<b>Post-conditions</b>	- The user is authenticated to a Federated IdP
<b>Description</b>	A User tries to authenticate to a CREDENTIAL SP using the CREDENTIAL Wallet and a Federated IdP (STORK). A strong authentication is performed using eID identities (eID smartcard)
<b>Image</b>	<pre> sequenceDiagram     actor User as «Human Actor» Foreign User     participant eID as «System Actor» eID-System     participant SP as «System Actor» CREDENTIAL Service Provider     participant STORK as «System Actor» STORK module     participant IdP as «System Actor» STORK IdP     participant Proxy as «System Actor» Proxy re-encryption Module      User-&gt;&gt;SP: Select CREDENTIAL Identity Provider     SP-&gt;&gt;User: Asks for credentials     User-&gt;&gt;eID: Inserts smartcard     eID-&gt;&gt;User: Asks to insert associated PIN     User-&gt;&gt;eID: Inserts PIN     eID-&gt;&gt;SP: Valid credentials     SP-&gt;&gt;IdP: Provides credentials     IdP-&gt;&gt;Proxy: Analyses provided user's credentials     Proxy-&gt;&gt;STORK: Collects requested users data     STORK-&gt;&gt;Proxy: Provides encrypted attributes     Proxy-&gt;&gt;STORK: Stores encrypted data     STORK-&gt;&gt;Proxy: Request Proxy re-encryption keys     Proxy-&gt;&gt;STORK: Re-encrypts data using CREDENTIAL     STORK-&gt;&gt;SP: Releases assertion     SP-&gt;&gt;User: Decrypts needed data using CREDENTIAL     SP-&gt;&gt;User: Provides access     alt [invalid user's credentials]         SP-&gt;&gt;User: access denied     end     </pre>

**A.2.2.7 Attributes Collection**

<b>Use Case Name</b>	<b>Attributes Collection</b>
<b>ID</b>	G-LUC-ATTCOLLECTION
<b>LUC_in</b>	<ul style="list-style-type: none"> <li>- Authenticate towards CREDENTIAL Wallet using a CREDENTIAL-enabled IdP</li> <li>- Authenticates towards CREDENTIAL Wallet using an external IdP</li> <li>- Authenticates towards a CREDENTIAL SP using CREDENTIAL Wallet and Identity Federation</li> </ul>
<b>Main Actor</b>	- Identity Provider
<b>Secondary Actors</b>	
<b>Pre-conditions</b>	- The User is authenticated in the Identity provider
<b>Post-conditions</b>	- The IdP collects the attributes needed from the user’s credential
<b>Description</b>	The Identity Provider extracts from its database the related information needed from the user’s credentials
<b>Image</b>	<pre> graph TD     subgraph Actor         direction TB         A["«System Actor» IDENTITY PROVIDER"]         B["«System Actor» IDENTITY PROVIDER"]     end     A -.-&gt; Extracts the attributes needed  B     </pre>

### A.2.2.8 Request Identity Assertion

<b>Use Case Name</b>	<b>Request Identity Assertion</b>
<b>ID</b>	G-LUC-REQIDENTIYASSERTION
<b>LUC_in</b>	Link Service Provider account with CREDENTIAL account
<b>Main Actor</b>	- Service Provider
<b>Secondary Actors</b>	- CREDENTIAL Personal Trust Store - CREDENTIAL Sign Service - CREDENTIAL Identity Provider - CREDENTIAL Participant Search Service
<b>Pre-conditions</b>	- Service Provider can identify the user's CREDENTIAL identifier
<b>Post-conditions</b>	- Identity Assertion Request is sent to the CREDENTIAL Identity Provider
<b>Description</b>	A Service Provider requests an Identity Assertion for a user who wants to access his service.
<b>Image</b>	<pre> sequenceDiagram     actor SP as «System Actor» Service Provider     participant CREDENTIAL as CREDENTIAL     participant CREDENTIAL_WALLET as CREDENTIAL Wallet     CREDENTIAL --&gt;&gt; SP: Create Identity Assertion Request     SP --&gt;&gt; CREDENTIAL: Search Participant     CREDENTIAL --&gt;&gt; SP: Add Participant Identifier to Identity Assertion Request     SP --&gt;&gt; CREDENTIAL: Read Private Key     CREDENTIAL --&gt;&gt; SP: Sign Identity Assertion Request     SP --&gt;&gt; CREDENTIAL_WALLET: Request Identity Assertion     CREDENTIAL_WALLET --&gt;&gt; SP:      </pre>

### A.2.2.9 Re-Encrypt Attributes

<b>Use Case Name</b>	<b>Re-Encrypt Attributes</b>
<b>ID</b>	G-LUC-ENCATTRIBUTES
<b>LUC_in</b>	Link Service Provider account with CREDENTIAL account
<b>Main Actor</b>	- Identity Provider
<b>Secondary Actors</b>	- CREDENTIAL Attribute Service - CREDENTIAL Authorization Service - CREDENTIAL Proxy Re-Encryption Service
<b>Pre-conditions</b>	- Requesters Information are available to the Identity Provider - Targets Information are available to the Identity Provider - Read Access Rights for the Requester on the Targets Identity Attributes are available at the Authorization Service
<b>Post-conditions</b>	- Identity Attributes are re-encrypted for the Requester
<b>Description</b>	The CREDENTIAL Wallet re-encrypts identity attributes of a user (the target) with a given proxy-re-encryption key (from target to requester).
<b>Image</b>	<p><b>Requester is the Participant who wants to read the Targets Identity Attributes</b></p> <p><b>Target is the Participant from which the identity attributes should be re-encrypted</b></p>

### A.2.2.10 Issue Identity Assertion

<b>Use Case Name</b>	<b>Issue Identity Assertion</b>
<b>ID</b>	G-LUC-ISSIDENTITYASSERTION
<b>LUC_in</b>	Link Service Provider account with CREDENTIAL account
<b>Main Actor</b>	- Identity Provider
<b>Secondary Actors</b>	- CREDENTIAL Sign Service
<b>Pre-conditions</b>	- Re-Encrypted Attributes are available to the Identity Provider
<b>Post-conditions</b>	- Re-Encrypted Attributes are added to the Identity Assertion - Identity Assertion is signed
<b>Description</b>	The CREDENTIAL Identity Provider issues an Identity Assertion with re-encrypted Attributes.
<b>Image</b>	<p>The diagram illustrates the process of issuing an identity assertion within the CREDENTIAL Wallet. It features four system actors: two Identity Providers (IP) and two Sign Services (SS). The top-left IP sends a message 'Add Re-Encrypted Attributes to Identity Assertion' to the top-right SS. The top-right SS then sends a message 'Sign Identity Assertion' to the bottom-right SS. A yellow callout box points to the top-left IP, indicating that the assertion could be a SAML-Assertion.</p>

### A.2.2.11 Receive Identity Assertion

<b>Use Case Name</b>	<b>Receive Identity Assertion</b>
<b>ID</b>	G-LUC-RECIDENTITYASSERTION
<b>LUC_in</b>	<ul style="list-style-type: none"> <li>- Link Service Provider account with CREDENTIAL account</li> <li>- Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and a CREDENTIAL-enabled IdP</li> <li>- Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and a IdP</li> <li>- Authenticate towards CREDENTIAL Wallet using CREDENTIAL-enabled IdP</li> <li>- Authenticate towards CREDENTIAL Wallet using an external IdP</li> <li>- Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and Identity Federation</li> </ul>
<b>Main Actor</b>	- Service Provider
<b>Secondary Actors</b>	- Identity Provider
<b>Pre-conditions</b>	
<b>Post-conditions</b>	
<b>Description</b>	The Service Providers receives the re-encrypted Identity Assertion from the CREDENTIAL Wallet.
<b>Image</b>	<pre> sequenceDiagram     participant CW as CREDENTIAL Wallet     participant IP1 as «System Actor» Identity Provider     participant IP2 as «System Actor» Identity Provider     participant SP as «System Actor» Service Provider     IP1--&gt;&gt;IP2     IP1--&gt;&gt;SP: Send Identity Assertion     </pre>

### A.2.2.12 Decrypt Identity Assertion

<b>Use Case Name</b>	<b>Decrypt Identity Assertion</b>
<b>ID</b>	G-LUC-DECIDENTITYASSERTION
<b>LUC_in</b>	<ul style="list-style-type: none"> <li>- Link Service Provider account with CREDENTIAL account</li> <li>- Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and a CREDENTIAL-enabled IdP</li> <li>- Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and a IdP</li> <li>- Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and Identity Federation</li> </ul>
<b>Main Actor</b>	- Service Provider
<b>Secondary Actors</b>	<ul style="list-style-type: none"> <li>- CREDENTIAL Personal Trust Store</li> <li>- CREDENTIAL Decryption Service</li> </ul>
<b>Pre-conditions</b>	<ul style="list-style-type: none"> <li>- Service Provider has CREDENTIAL account</li> <li>- Identity Assertion is issued for the Service Provider</li> <li>- Identity Attributes are encrypted with a proxy-re-encryption schema</li> </ul>
<b>Post-conditions</b>	- Service Provider can read the Identity Attributes
<b>Description</b>	The Service Provider decrypts an Identity Assertion issued by a CREDENTIAL Wallet.
<b>Image</b>	<pre> sequenceDiagram     actor SP as «System Actor» Service Provider     actor PTT as «System Actor» Personal Trust Store     actor DS as «System Actor» Decryption Service     SP-&gt;&gt;SP: Parse Identity Attributes     SP-&gt;&gt;PTT: Read Private Key     loop [For Each Encrypted Identity Attribute]         SP-&gt;&gt;DS: Decrypt Identity Attribute     end     </pre>

### A.2.2.13 Create Logout Request

<b>Use Case Name</b>	<b>Create Logout Request</b>
<b>ID</b>	G-LUC-CREATELOGOUTREQ
<b>LUC_in</b>	Logout from CREDENTIAL Wallet
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	
<b>Pre-conditions</b>	- Participant has a valid session
<b>Post-conditions</b>	- Logout Request is available at Participant's IT-System
<b>Description</b>	The CREDENTIAL Participant's IT-System creates a logout request.
<b>Image</b>	

### A.2.2.14 Submit Logout Request

<b>Use Case Name</b>	<b>Submit Logout Request</b>
<b>ID</b>	G-LUC-LOGOUTCREDWALLET
<b>LUC_in</b>	Logout from CREDENTIAL Wallet
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Wallet
<b>Pre-conditions</b>	- Logout Request was created on the Participant's IT-System
<b>Post-conditions</b>	- Logout Request is available at the CREDENTIAL Wallet
<b>Description</b>	The CREDENTIAL Participant's IT-System sends the logout request to the CREDENTIAL Wallet.
<b>Image</b>	

### A.2.2.15 Invalidate Session

<b>Use Case Name</b>	<b>Invalidate Session</b>
<b>ID</b>	G-LUC-INVSESSION
<b>LUC_in</b>	Logout from CREDENTIAL Wallet
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	
<b>Pre-conditions</b>	<ul style="list-style-type: none"> <li>- Participant requests a logout</li> <li>- Participant has a valid session</li> </ul>
<b>Post-conditions</b>	<ul style="list-style-type: none"> <li>- Session is invalidated</li> <li>- Participant is not able to use CREDENTIAL services</li> </ul>
<b>Description</b>	The CREDENTIAL Wallet invalidates the specified session. The user can no longer use this session.
<b>Image</b>	<pre> sequenceDiagram     actor Actor1 as CREDENTIAL Wallet     actor Actor2 as CREDENTIAL Wallet     Actor1--&gt;&gt;Actor2: Identify Session     Actor1--&gt;&gt;Actor2: Invalidate Session     </pre>

### A.2.2.16 Respond Successfully Logout

<b>Use Case Name</b>	<b>Respond Successfully Logout</b>
<b>ID</b>	G-LUC-RESPTSUCCLOGOUT
<b>LUC_in</b>	Logout from CREDENTIAL Wallet
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant's IT-System
<b>Pre-conditions</b>	- Participant requests a logout - Participant was logout from the CREDENTIAL Wallet
<b>Post-conditions</b>	- Participant received a logout confirmation
<b>Description</b>	The CREDENTIAL Wallet sends a successfully logout confirmation to the CREDENTIAL Participant's IT-System.
<b>Image</b>	<pre> sequenceDiagram     actor Actor1 as CREDENTIAL Participant's IT-System     actor Actor2 as CREDENTIAL Wallet     Actor2-&gt;&gt;Actor1: Send Logout confirmation     </pre> <p>The diagram illustrates the communication between two entities: CREDENTIAL Participant's IT-System and CREDENTIAL Wallet. Both are represented by stick figures. A red arrow points from the CREDENTIAL Wallet actor to the CREDENTIAL Participant's IT-System actor, labeled 'Send Logout confirmation'.</p>

### A.2.2.17 User Authentication using IdP

<b>Use Case Name</b>	<b>User Authentication using IdP</b>
<b>ID</b>	G-LUC-XYZ
<b>LUC_in</b>	<ul style="list-style-type: none"> <li>- Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and a CREDENTIAL-enabled IdP</li> <li>- Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and a IdP</li> <li>- Authenticate towards CREDENTIAL Wallet using a CREDENTIAL-enabled IdP</li> <li>- Authenticate towards CREDENTIAL Wallet using an external IdP</li> <li>- Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and Identity Federation</li> </ul>
<b>Main Actor</b>	- CREDENTIAL Participant
<b>Secondary Actors</b>	- Identity Provider
<b>Pre-conditions</b>	<ul style="list-style-type: none"> <li>- User has a CREDENTIAL account</li> <li>- User has write access rights</li> </ul>
<b>Post-conditions</b>	- The IdP receives the user's credentials
<b>Description</b>	A user initiates an authentication against an Identity Provider, using the credentials.
<b>Image</b>	<pre> sequenceDiagram     actor User1 as «Human Actor» User     actor User2 as «Human Actor» User     participant IdP as «System Actor» Identity provider     User1-&gt;&gt;IdP: Ask for authentication     IdP-&gt;&gt;User2: Ask for credentials     User2-&gt;&gt;IdP: Provide user's credential     </pre>

**A.2.2.18 Ask for a List of IdPs**

<b>Use Case Name</b>	<b>Ask for a List of IdPs</b>
<b>ID</b>	G-LUC-ASKIDPS
<b>LUC_in</b>	Select CREDENTIAL Identity Provider
<b>Main Actor</b>	- IdP Selector
<b>Secondary Actors</b>	- Service Provider
<b>Pre-conditions</b>	
<b>Post-conditions</b>	- List of IdPs is available at the Service Provider
<b>Description</b>	A Service Provider requests a list of IdPs which are available using CREDENTIAL technology.
<b>Image</b>	<pre> sequenceDiagram     participant SP as Service Provider     participant IS as IdP Selector     SP-&gt;&gt;IS: Query List of IdPs     activate IS     IS-&gt;&gt;IS: Find IdPs     deactivate IS     IS--&gt;&gt;SP: Return List of IdPs     </pre>

**A.2.2.19 Ask to select an IdP from the provided List**

<b>Use Case Name</b>	<b>Ask to select an IdP from the provided List</b>
<b>ID</b>	G-LUC-ASKIDPFROMLIST
<b>LUC_in</b>	Select CREDENTIAL Identity Provider
<b>Main Actor</b>	- CREDENTIAL Participant
<b>Secondary Actors</b>	- Service Provider
<b>Pre-conditions</b>	- User has requested access to protected resource
<b>Post-conditions</b>	- List of IdPs available at user.
<b>Description</b>	A Service Provider sends a list of available IdPs to the user. The user is know able to choose which IdP to use for the authentication process against the Service Provider.
<b>Image</b>	<pre> sequenceDiagram     participant U as User     participant SP as Service Provider     SP-&gt;&gt;U: Send IdP list     </pre>

### A.2.2.20 Select an IdP

<b>Use Case Name</b>	<b>Select an IdP</b>
<b>ID</b>	G-LUC-SELECTIDP
<b>LUC_in</b>	Select CREDENTIAL Identity Provider
<b>Main Actor</b>	- CREDENTIAL Participant
<b>Secondary Actors</b>	- IdP Selector
<b>Pre-conditions</b>	- User has a list of IdPs - User requested access to a protected resource
<b>Post-conditions</b>	- Selected IdP is known to the IdP selector
<b>Description</b>	A user received a list of IdPs. He is now challenged to choose one of the IdPs.
<b>Image</b>	

**A.2.2.21 IdP Selector Redirects User to the Selected IdP**

<b>Use Case Name</b>	<b>IdP Selector Redirects User to the Selected IdP</b>
<b>ID</b>	G-LUC-REDIRECTUSER
<b>LUC_in</b>	Select CREDENTIAL Identity Provider
<b>Main Actor</b>	- IdP Selector
<b>Secondary Actors</b>	- CREDENTIAL Participant - Identity Provider
<b>Pre-conditions</b>	- User has sent a selected IdP to the IdP selector
<b>Post-conditions</b>	- User is redirected to IdP
<b>Description</b>	An IdP selector queries the address of a selected IdP. The user is redirected to this IdP.
<b>Image</b>	<pre> sequenceDiagram     actor User     actor IdP_selector as IdP selector     actor Identity_Provider as Identity Provider     IdP_selector-&gt;&gt;Identity_Provider: Query IdP     Identity_Provider--&gt;&gt;IdP_selector: Query selected IdP address     IdP_selector-&gt;&gt;User: Redirect user     </pre> <p>The diagram illustrates the process where the IdP selector queries the Identity Provider for the address of the selected IdP, and then redirects the User to that IdP.</p>

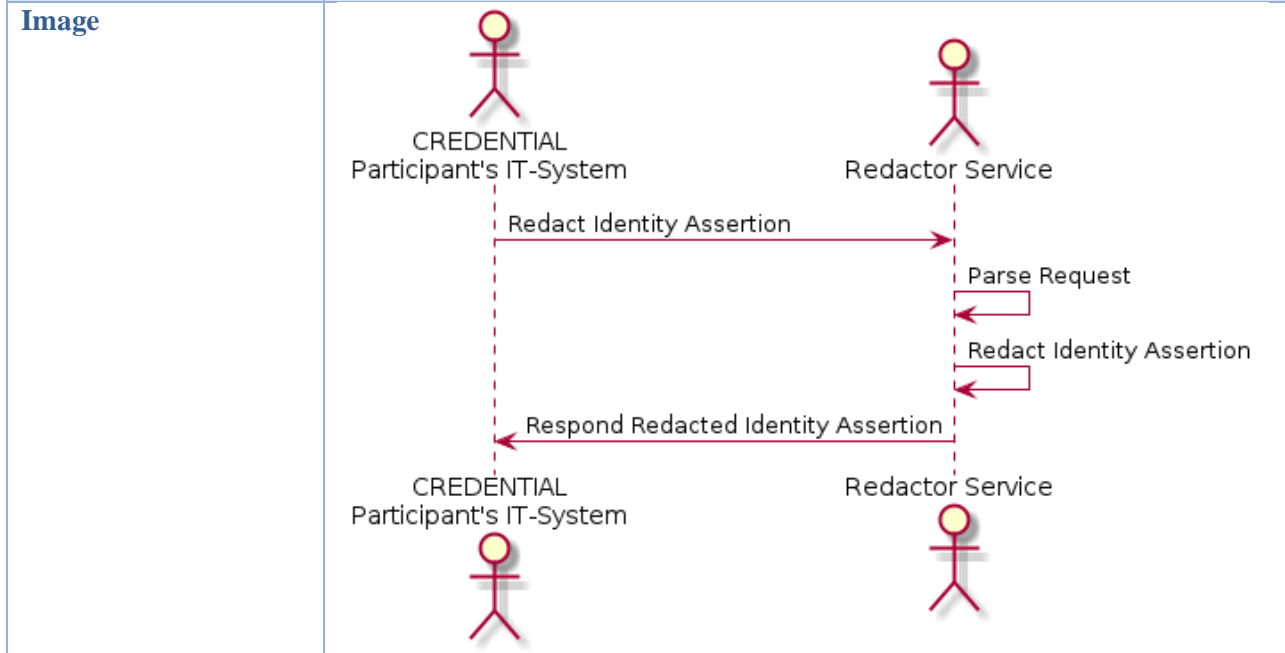

### A.2.2.22 Select Attributes to Disclose

<b>Use Case Name</b>	<b>Select Attributes to Disclose</b>
<b>ID</b>	G-LUC-SELECTATTRDISCLOSE
<b>LUC_in</b>	Selective Disclosure
<b>Main Actor</b>	- CREDENTIAL Participant
<b>Secondary Actors</b>	- CREDENTIAL Participant's IT-System
<b>Pre-conditions</b>	- User has an Identity Assertion
<b>Post-conditions</b>	- User has selected the Attributes to disclose
<b>Description</b>	A user wants to disclose attributes from an Identity Assertion. He sees the available attributes in his Identity Assertion and selects which one of them should be disclosed.
<b>Image</b>	<pre> sequenceDiagram     actor User1 as «Human Actor» User     actor IT1 as «System Actor» CREDENTIAL Participant's IT-System     actor User2 as «Human Actor» User     actor IT2 as «System Actor» CREDENTIAL Participant's IT-System      User1-&gt;&gt;IT1: Request Select Attributes to disclose     IT1-&gt;&gt;User2: Select Attributes     </pre>

### A.2.2.23 Redact Identity Assertion

<b>Use Case Name</b>	<b>Redact Identity Assertion</b>
<b>ID</b>	G-LUC-REDACTIDASSERTION
<b>LUC_in</b>	Selective Disclosure
<b>Main Actor</b>	- CREDENTIAL Redactor Service
<b>Secondary Actors</b>	- CREDENTIAL Participant's IT-System
<b>Pre-conditions</b>	- Participant possesses an Identity Assertion - Signature of Identity Assertion is capable to redact attributes
<b>Post-conditions</b>	- Attributes of Identity Assertion are redacted - Signature still valid - Redacted Identity Assertion available at Participant's IT-System
<b>Description</b>	A Participant want to redact attributes in his Identity Assertion. He requests this operation at the Redactor Service by providing the Identity Assertion and the attributes to redact.

### A.2.2.24 Provide Identity Assertion

<b>Use Case Name</b>	<b>Provide Identity Assertion</b>
<b>ID</b>	G-LUC-PROVIDASSERTION
<b>LUC_in</b>	Selective Disclosure
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- Service Provider
<b>Pre-conditions</b>	- Participant owns an Identity Assertion - Identity Assertion may be redacted
<b>Post-conditions</b>	- Participant has performed necessary steps to process the Identity Assertion - Identity Assertion is available at Service Provider
<b>Description</b>	A participant possesses an Identity Assertion. The Identity Assertion has to be provided towards a Service Provider in order to access a protected resource.
<b>Image</b>	<pre> sequenceDiagram     actor IT as CREDENTIAL Participant's IT-System     actor SP as Service Provider     IT-&gt;&gt;SP: Send Identity Assertion     SP--&gt;&gt;IT: Process Identity Assertion     </pre> <p>e.g. a proof of possession has to be integrated in the Identity Assertion</p>

### A.2.2.25 Verify Identity Assertion

<b>Use Case Name</b>	<b>Verify Identity Assertion</b>
<b>ID</b>	G-LUC-VERIDASSERTION
<b>LUC_in</b>	Selective Disclosure
<b>Main Actor</b>	- Service Provider
<b>Secondary Actors</b>	- CREDENTIAL Sign Service
<b>Pre-conditions</b>	- Identity Assertion is issued by a CREDENTIAL enabled Identity Provider - A Service Provider receives an Identity Assertion
<b>Post-conditions</b>	- Service Provider has verified the Identity Assertion
<b>Description</b>	In order to access protected resources on a Service Provider a user has to provide an Identity Assertion. In case CREDENTIAL technology is used in the issuing process the Service Provider has to use some CREDENTIAL services in order to process an Identity Assertion. For example, the Identity Assertion can be protected by a malleable signature which is created by CREDENTIAL technology. By using the CREDENTIAL Sign Service such a signature can still be verified.
<b>Image</b>	<pre> sequenceDiagram     actor SP as «System Actor» Service Provider     actor CSS as «System Actor» CREDENTIAL Sign Service     actor SP2 as «System Actor» Service Provider     actor CSS2 as «System Actor» CREDENTIAL Sign Service      SP-&gt;&gt;CSS: Verify Identity Assertion     alt [verify successfull]         CSS-&gt;&gt;SP: Process Identity Assertion         SP-&gt;&gt;R: Process further request     else [verify unsuccessful]         CSS-&gt;&gt;SP: Provide Exception     end     </pre>

### A.2.3 Authorization

#### A.2.3.1 Request Access Rights

<b>Use Case Name</b>	<b>Request Access Rights</b>
<b>ID</b>	G-LUC-REQACCESSRIGHTS
<b>LUC_in</b>	EXPORT CREDENTIAL Wallet data into form
<b>Main Actor</b>	- Service Provider
<b>Secondary Actors</b>	- CREDENTIAL Authorization Service - CREDENTIAL Personal Trust Store - CREDENTIAL Participant's IT-System - CREDENTIAL Sign Service - CREDENTIAL Participant Search Service
<b>Pre-conditions</b>	- Service Provider has a CREDENTIAL account
<b>Post-conditions</b>	- The information which data the Service Provider wants to access is propagated to the user or the CREDENTIAL Wallet - The Service Provider's CREDENTIAL account information is propagated to the user or the CREDENTIAL Wallet.
<b>Description</b>	The Service Providers needs access to data from the user from his CREDENTIAL Wallet. The Service Providers reads his public key from his Personal Trust Store. The Service Provider creates the Access Rights he wants to have. The Public Key and the Access Rights are compiled in a Request Access Rights object and signed with the Sign Service. In a Request Access Rights, the Service Provider requests access to the data in the CREDENTIAL Wallet. The Request Access Rights object is send to the user's IT-System or directly to the CREDENTIAL Wallet.
<b>Image</b>	

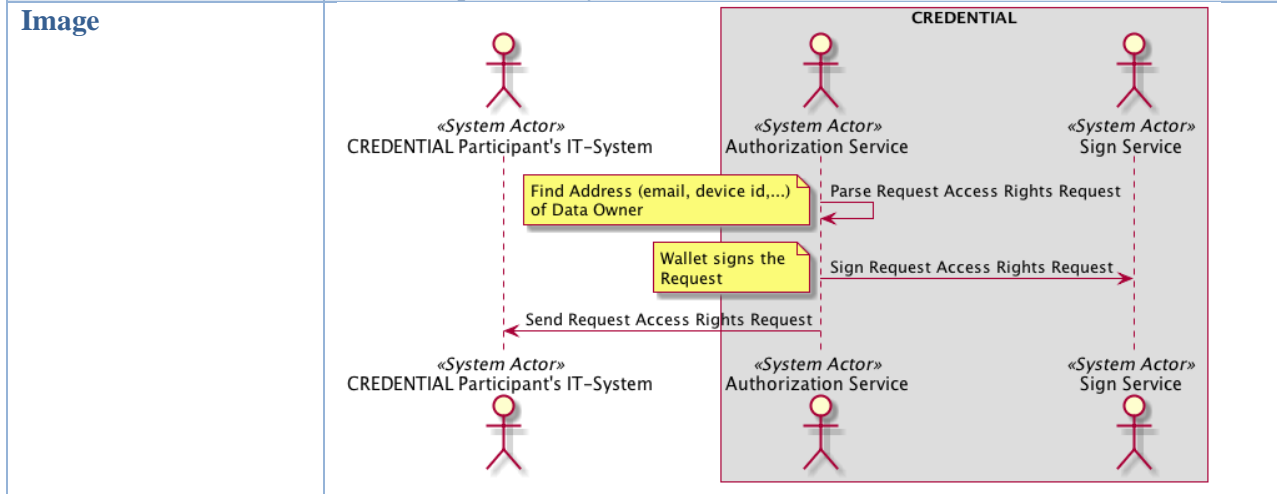

### A.2.3.2 Register Access Rights Request

<b>Use Case Name</b>	<b>Register Access Rights Request</b>
<b>ID</b>	G-LUC-REGACCESSRIGHTSREQ
<b>LUC_in</b>	Request Access Rights
<b>Main Actor</b>	- CREDENTIAL Authorization Service
<b>Secondary Actors</b>	- CREDENTIAL Participant Search Service - CREDENTIAL Participant Index
<b>Pre-conditions</b>	- Authorization Service has received a Request Access Rights Request
<b>Post-conditions</b>	- Authorization Service has stored the Request Access Rights Request - Authorization Service has identified the Data Owner's Information - Authorization Service has identified the Requester's Information
<b>Description</b>	The CREDENTIAL Wallet registers and processes the access rights request. The Authorization Service searches for the participant who originates the Access Rights Request. The Participant Search Service uses the Participant Index to retrieve the participant's public key. The Authorization Service verifies the provided signature in the Request Access Rights. If verified, the Authorization service searches for the data owner mentioned in the Request Access Rights. If found, the Authorization Service stores the Request Access Rights for further processing.
<b>Image</b>	<pre> sequenceDiagram     actor AS as «System Actor» Authorization Service     actor PSS as «System Actor» Participant Search Service     actor PI as «System Actor» Participant Index     AS-&gt;&gt;PSS: Search Participant     Note over AS: Search Requester in Request Access Rights Request     PSS-&gt;&gt;PI: Search Participant Information     Note over PI: Identifier Public Key     PI--&gt;&gt;AS: Verify Request Access Rights Signature     AS-&gt;&gt;PSS: Search Participant     Note over AS: Search Data Owner in Request Access Rights Request     PSS-&gt;&gt;PI: Search Participant Information     Note over PI: Identifier Public Key, Address-Information (e-mail, etc.)     PI--&gt;&gt;AS: Store Request Access Rights Request     </pre>

### A.2.3.3 Provide Access Rights Request

<b>Use Case Name</b>	<b>Provide Access Rights Request</b>
<b>ID</b>	G-LUC-PROVACCESSRIGHTSREQ
<b>LUC_in</b>	Request Access Rights
<b>Main Actor</b>	- CREDENTIAL Authorization Service
<b>Secondary Actors</b>	- CREDENTIAL Sign Service - CREDENTIAL Participant's IT-System
<b>Pre-conditions</b>	- Request Access Rights Request is available at the Authorization Service
<b>Post-conditions</b>	- Request Access Rights Request is signed by the CREDENTIAL Wallet - Request Access Rights Request is provided to the data owner
<b>Description</b>	The CREDENTIAL Wallet provides the access right request to the specified CREDENTIAL Participant's IT-System. The Request Access Rights is parsed by the Authorization Service and the user's destination address or device id are identified. The Request Access Rights Request is signed by the CREDENTIAL Wallet. The signed Request Access Rights Request is send to the Participant's IT-System.

### A.2.3.4 Define Access Rights

<b>Use Case Name</b>	<b>Define Access Rights</b>
<b>ID</b>	G-LUC-DEFINEACCESSRIGHTS
<b>LUC_in</b>	Grant Access Rights
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Participant Search Service
<b>Pre-conditions</b>	
<b>Post-conditions</b>	- Access Rights have been defined
<b>Description</b>	A CREDENTIAL Participant defines access rights for data in a CREDENTIAL Wallet using his IT-System. The Participant's IT-System uses the Participant Search Service in order to search for the Participant to whom access rights will be granted. The Participant defines the action he wants to perform on the data set and identifies the data set. Finally, the Access Rights are created by the Participant's IT-System with the information provided so far. User interaction is probably involved in this use case.
<b>Image</b>	

### A.2.3.5 Grant Access Rights

<b>Use Case Name</b>	<b>Grant Access Rights</b>
<b>ID</b>	G-LUC-GRANTACCESSRIGHTS
<b>LUC_in</b>	Grant Access Rights
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Personal Trust Store - CREDENTIAL Sign Service - CREDENTIAL Re-Encryption Key Generation Service
<b>Pre-conditions</b>	- Access Rights Request is present to the IT-System - Participant has a CREDENTIAL account
<b>Post-conditions</b>	- Re-Encryption Key is added to Access Rights - Access Rights are signed by the Participant
<b>Description</b>	A CREDENTIAL Participant uses his IT-System to grant access rights on data in the CREDENTIAL Wallet using CREDENTIAL technology. E.g. a proxy-re-encryption key has to be generated. The Participant's IT-Systems reads the private key from the Personal Trust Store. The Participant's IT-System verifies the Access Rights. It checks if the provided signature by the CREDENTIAL Wallet and the requester are created properly. On success, the requester's public key is parsed from the Access Rights. If the Access Rights describe a read access to a resource, together with the private key and the public key a proxy-re-encryption key is created. The Re-Encryption Key is added to the Access Rights and signed by the Sign Service. If the Access Rights are not successfully verified, an error is respond to the Participant's IT-System.
<b>Image</b>	<pre> sequenceDiagram     actor IT as «System Actor» CREDENTIAL Participant's IT-System     actor PTT as «System Actor» Personal Trust Store     actor SS as «System Actor» Sign Service     actor REK as «System Actor» Re-Encryption Key Generation Service      IT-&gt;&gt;PTT: Read Private Key     PTT--&gt;&gt;IT:      IT-&gt;&gt;SS: Verify Access Rights     SS--&gt;&gt;IT:      alt [Verify Successful]         opt [Read Access]             IT-&gt;&gt;SS: Parse Access Rights             SS--&gt;&gt;IT:              IT-&gt;&gt;REK: Create Re-Encryption Key             REK--&gt;&gt;IT:              IT-&gt;&gt;SS: Process Access Rights             SS--&gt;&gt;IT:              IT-&gt;&gt;SS: Sign Access Rights             SS--&gt;&gt;IT:          end     else [Verify Failed]         IT--&gt;&gt;IT: Respond Error     end     </pre>

### A.2.3.6 Provide Access Rights

<b>Use Case Name</b>	<b>Provide Access Rights</b>
<b>ID</b>	G-LUC-PROVIDEACCESSRIGHTS
<b>LUC_in</b>	<ul style="list-style-type: none"> <li>- Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and a CREDENTIAL-enabled IdP</li> <li>- Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and a IdP</li> <li>- Authenticate towards CREDENTIAL Wallet using a CREDENTIAL-enabled IdP</li> <li>- Authenticate towards CREDENTIAL Wallet using an external IdP</li> <li>- Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and Identity Federation</li> <li>- Grant Access Rights</li> </ul>
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Authorization Service
<b>Pre-conditions</b>	- Access Rights were created or modified by the Participant's IT-System
<b>Post-conditions</b>	- Access Rights are available in the CREDENTIAL Wallet at the Authorization Service.
<b>Description</b>	The CREDENTIAL Participant's IT-System provides the granted access rights to the CREDENTIAL Wallet.
<b>Image</b>	<pre> sequenceDiagram     actor IT as «System Actor» CREDENTIAL Participant's IT-System     actor Auth as «System Actor» CREDENTIAL Authorization Service     Note over Auth: CREDENTIAL     IT-&gt;&gt;Auth: Send Access Rights     </pre>

### A.2.3.7 Register Access Rights

<b>Use Case Name</b>	<b>Register Access Rights</b>
<b>ID</b>	G-LUC-REGACCESSRIGHTS
<b>LUC_in</b>	Grant Access Rights
<b>Main Actor</b>	- CREDENTIAL Authorization Service
<b>Secondary Actors</b>	- CREDENTIAL Audit Trail Service
<b>Pre-conditions</b>	- Unregistered Access Rights are available to the Authorization Service
<b>Post-conditions</b>	- Access Rules have been created - Re-Encryption Key has been stored
<b>Description</b>	The CREDENTIAL Wallet registers the access rights. The Authorization Service verifies the signature of the participant who grants the access rights contained in the Access Rights. If the signature is valid a new Access Rule is created at the Authorization Service based on the information provided in the Access Rights. The Re-Encryption Key is extracted from the Access Rights and stored at the Authorization Service. If the signature is not valid, the Access Rights are rejected and no Access Rule or Re-Encryption Key has been created or stored.
<b>Image</b>	<pre> sequenceDiagram     actor AS as «System Actor» Authorization Service     actor ATS as «System Actor» Audit Trail Service     AS-&gt;&gt;ATS: Verify Access Rights Signature     alt [Signature is valid]         AS-&gt;&gt;AS: Create Access Rule         AS-&gt;&gt;AS: Store Re-Encryption Key     else [Signature is invalid]         AS-&gt;&gt;AS: Reject Access Rights     end     ref Auditing         AS-&gt;&gt;ATS:      end     </pre>

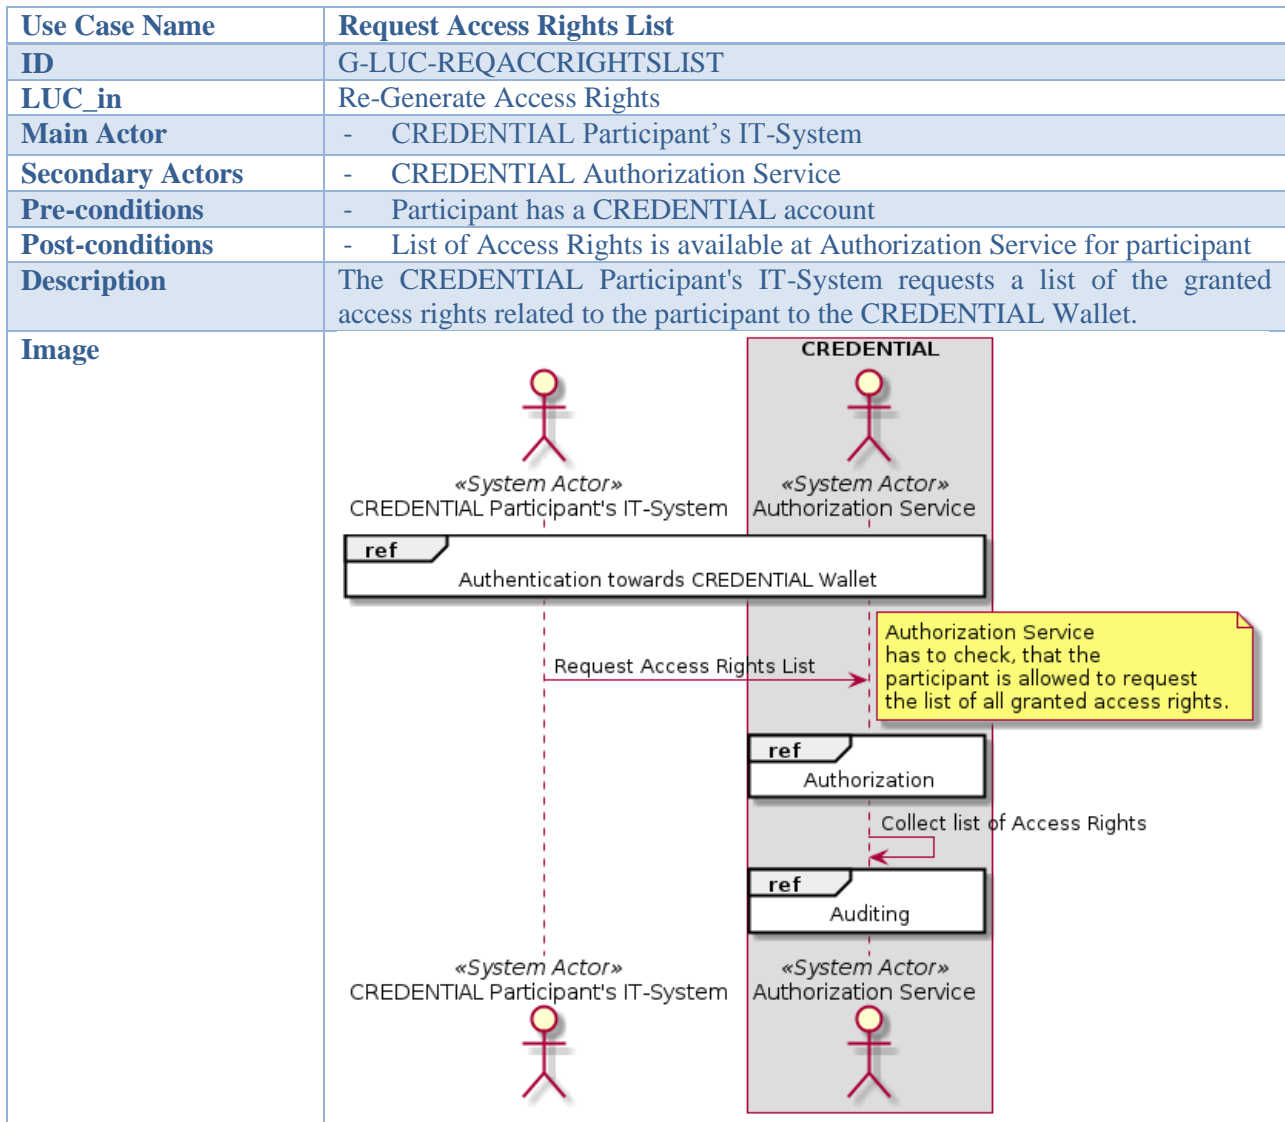

### A.2.3.8 Verify Re-Encryption Request

<b>Use Case Name</b>	<b>Verify Re-Encryption Request</b>
<b>ID</b>	G-LUC-VERREENCREQ
<b>LUC_in</b>	Generate new access-key for CREDENTIAL Wallet
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Sign Service
<b>Pre-conditions</b>	
<b>Post-conditions</b>	
<b>Description</b>	The Wallet must ensure the re-encryption requests are valid (from the data owner)
<b>Image</b>	<pre> sequenceDiagram     actor Wallet1 as «System Actor» CREDENTIAL Wallet     actor SignService1 as «System Actor» Sign Service     actor Wallet2 as «System Actor» CREDENTIAL Wallet     actor SignService2 as «System Actor» Sign Service     Wallet1-&gt;&gt;SignService1: Verify signature     </pre>

### A.2.3.9 Request Access Rights List

### A.2.3.10 Receive Access Rights List

<b>Use Case Name</b>	<b>Receive Access Rights List</b>
<b>ID</b>	G-LUC-RECAACCESSRIGHTSLIST
<b>LUC_in</b>	Re-Generate Access Rights
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Wallet
<b>Pre-conditions</b>	- Access Rights List was requested by the participant
<b>Post-conditions</b>	- Access Rights List is available at the participant's IT-System
<b>Description</b>	The CREDENTIAL Participant's IT-System receives the granted access rights related to the participant stored in the CREDENTIAL Wallet.
<b>Image</b>	<pre> sequenceDiagram     actor Actor1 as «System Actor» CREDENTIAL Participant's IT-System     actor Actor2 as «System Actor» CREDENTIAL Authorization Service     Actor2-&gt;&gt;Actor1: Provide Access Rights List     </pre>

### A.2.3.11 Access Denied

<b>Use Case Name</b>	<b>Access Denied</b>
<b>ID</b>	G-LUC-ACCESSDENIED
<b>LUC_in</b>	<ul style="list-style-type: none"> <li>- Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and a CREDENTIAL-enabled IdP</li> <li>- Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and a IdP</li> <li>- Authenticate towards CREDENTIAL Wallet using a CREDENTIAL-enabled IdP</li> <li>- Authenticate towards CREDENTIAL Wallet using an external IdP</li> <li>- Authenticate towards a CREDENTIAL SP using CREDENTIAL Wallet and Identity Federation</li> </ul>
<b>Main Actor</b>	- CREDENTIAL Authorization Service
<b>Secondary Actors</b>	- CREDENTIAL Participant
<b>Pre-conditions</b>	<ul style="list-style-type: none"> <li>- User has an account</li> <li>- User has access to his credentials</li> </ul>
<b>Post-conditions</b>	- User is not able to access CREDENTIAL services
<b>Description</b>	The access for a user is denied by CREDENTIAL.
<b>Image</b>	<pre> sequenceDiagram     actor User as «Human Actor» User     participant CREDENTIAL as CREDENTIAL     participant Auth as «System Actor» Authorization Service     Note over CREDENTIAL, Auth: CREDENTIAL     User--&gt;&gt;Auth:      Auth--&gt;&gt;User: Return Access Denied     </pre>

## A.2.4 Account Management

### A.2.4.1 Register Link Account Request

<b>Use Case Name</b>	<b>Register Link Account Request</b>
<b>ID</b>	G-LUC-REGLINKACCREQ
<b>LUC_in</b>	Link Service Provider account with CREDENTIAL account
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Authorization Service
<b>Pre-conditions</b>	- New Link Account Request is available to the wallet
<b>Post-conditions</b>	- Link Account Request is stored in the wallet - Read Access Rule on the Identity Attributes of the Participant for the Requester are created - Re-Encryption Key is stored
<b>Description</b>	The CREDENTIAL Wallet registers a link account request.  E.g. Register the proxy-re-encryption key. Register the callback URL
<b>Image</b>	<p>The diagram is a UML Use Case diagram titled "CREDENTIAL Wallet". It features four stick figures representing system actors: two labeled "«System Actor» CREDENTIAL Wallet" and two labeled "«System Actor» Authorization Service". The interactions are as follows:         <ul style="list-style-type: none"> <li>The top-left "CREDENTIAL Wallet" actor sends a message "Parse Link Account Request" to the top-right "Authorization Service" actor.</li> <li>The top-right "Authorization Service" actor sends a message "Verify Link Account Request Signature" to the top-left "CREDENTIAL Wallet" actor.</li> <li>The top-left "CREDENTIAL Wallet" actor sends a message "Create Access Rights" to the top-right "Authorization Service" actor.</li> <li>The top-left "CREDENTIAL Wallet" actor sends a message "Register Proxy-Re-Encryption Key" to the top-right "Authorization Service" actor.</li> <li>The top-left "CREDENTIAL Wallet" actor sends a message "Store Link Account Request" to the bottom-left "CREDENTIAL Wallet" actor.</li> </ul>         A yellow callout box points to the "Create Access Rights" message with the text: "Access Rights on Identity Attributes for the specified participants in the Link Account Request".       </p>

### A.2.4.2 Generate new Keypair

<b>Use Case Name</b>	<b>Generate new Keypair</b>
<b>ID</b>	G-LUC-GENKEYPAIR
<b>LUC_in</b>	Generate new access-key for CREDENTIAL Wallet
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Personal Trust Store - CREDENTIAL Key Generation Service
<b>Pre-conditions</b>	- CREDENTIAL Services are installed on the Participant's IT-System
<b>Post-conditions</b>	- The participant has a new public key component and its private counterpart stored in its trust store
<b>Description</b>	The participant requires a new public key/pair, whether it is for registering for the first time in CREDENTIAL or to replace his old one. The private key component is stored in the participant's trust store while the public one is directly returned.
<b>Image</b>	

### A.2.4.3 Create Link Account Request using CREDENTIAL

<b>Use Case Name</b>	<b>Create Link Account Request using CREDENTIAL</b>
<b>ID</b>	G-LUC-LINKACCREQ
<b>LUC_in</b>	Link Service Provider account with CREDENTIAL account
<b>Main Actor</b>	- Service Provider
<b>Secondary Actors</b>	- CREDENTIAL Personal Trust Store - CREDENTIAL Sign Service
<b>Pre-conditions</b>	- Service Provider has a CREDENTIAL account
<b>Post-conditions</b>	- Link Account Request has been created - Callback URL is accessible
<b>Description</b>	The Service Provider creates a Link Account Request. The Link Account Request contains of - a callback URL - Service Provider's CREDENTIAL account information. The purpose of a link account is to combine the accounts of a participant registered at the service provider with his CREDENTIAL account. Thus he is able to login to the Service Provider with his CREDENTIAL account.
<b>Image</b>	<pre> sequenceDiagram     actor SP as «System Actor» Service Provider     participant CREDENTIAL as CREDENTIAL     actor PTT as «System Actor» Personal Trust Store     actor SS as «System Actor» Sign Service      SP-&gt;&gt;PTT: Read Public Key     SP-&gt;&gt;SP: Create Callback URL     SP-&gt;&gt;PTT: Create Link Account Request     Note over SP,PTT: Add Callback URL Add Public Key     SP-&gt;&gt;PTT: Read Private Key     SP-&gt;&gt;SS: Sign Link Account Request     </pre>

### A.2.4.4 Redirect User to CREDENTIAL Authentication

<b>Use Case Name</b>	<b>Redirect User to CREDENTIAL Authentication</b>
<b>ID</b>	G-LUC-REDIRECTUSERCREDAUTH
<b>LUC_in</b>	Link Service Provider account with CREDENTIAL account
<b>Main Actor</b>	- Service Provider
<b>Secondary Actors</b>	- CREDENTIAL Participant's IT-System
<b>Pre-conditions</b>	- Link Account Request has been created
<b>Post-conditions</b>	- Participant's IT-System has received the Link Account Request - Participant's IT-System has received the Redirect Request
<b>Description</b>	The Service Provider redirects a user to the CREDENTIAL Authentication page. The Service Provider provides additional information to the User while redirecting. E.g. providing Link Account Request.
<b>Image</b>	<pre> sequenceDiagram     actor SP as «System Actor» Service Provider     actor IT as «System Actor» CREDENTIAL Participant's IT-System     SP-&gt;&gt;IT: Create Redirect Request     Note left of SP: Add CREDENTIAL Wallet URL Add Link Account Request     SP-&gt;&gt;IT: Send Redirect Request     </pre>

### A.2.4.5 Provide Link Account Request

<b>Use Case Name</b>	<b>Provide Link Account Request</b>
<b>ID</b>	G-LUC-PROVLINKACCREQ
<b>LUC_in</b>	Link Service Provider account with CREDENTIAL account
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Personal Trust Store - CREDENTIAL Sign Service - CREDENTIAL Proxy Re-Encryption Key Generation Service - CREDENTIAL Wallet
<b>Pre-conditions</b>	- The user is authenticated - Link Account Request is provided to the Participant's IT-System
<b>Post-conditions</b>	- Re-Encryption Key has been created - Link Account Request has been signed by the Participant - Link Account Request is available at the wallet.
<b>Description</b>	The User provides a Link Account Request to the CREDENTIAL Wallet.
<b>Image</b>	<pre> sequenceDiagram     actor IT as «System Actor» CREDENTIAL Participant's IT-System     actor PTT as «System Actor» Personal Trust Store     actor SS as «System Actor» Sign Service     actor PRK as «System Actor» Proxy-Re-Encryption Key Generation Service     actor CW as «System Actor» CREDENTIAL Wallet      Note over IT: Read Service Providers Public Key from Link Account Request     IT-&gt;&gt;IT: Read Private Key     IT-&gt;&gt;PRK: Create Proxy-Re-Encryption Key     PRK--&gt;&gt;IT: Add Proxy-Re-Encryption Key to Link Account Request     IT-&gt;&gt;SS: Sign Link Account Request     SS--&gt;&gt;IT: Send Link Account Request     IT-&gt;&gt;CW: Send Link Account Request     </pre> <p>The diagram illustrates the sequence of operations for providing a link account request. It involves the CREDENTIAL Participant's IT-System, the CREDENTIAL Personal Trust Store, the CREDENTIAL Sign Service, the CREDENTIAL Proxy-Re-Encryption Key Generation Service, and the CREDENTIAL Wallet. The process starts with the IT-System reading a public key from a request and its own private key. It then generates a proxy-re-encryption key using the Personal Trust Store and adds it to the request. The request is then signed by the Sign Service and finally sent to the Wallet.</p>

### A.2.4.6 Authorization

<b>Use Case Name</b>	<b>Authorization</b>
<b>ID</b>	G-LUC-AUTHORIZATION
<b>LUC_in</b>	Link Service Provider account with CREDENTIAL account
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Authorization Service
<b>Pre-conditions</b>	- Participant is authenticated - CREDENTIAL Wallet knows the action the user wants to perform - CREDENTIAL Wallet know the resource he wants to access
<b>Post-conditions</b>	- Authorization decision has been made
<b>Description</b>	The CREDENTIAL Wallet authorizes a participant for a specific action he wants to perform on a given resource.  E.g. participant wants to read user data.
<b>Image</b>	

### A.2.4.7 Search User

<b>Use Case Name</b>	<b>Search User</b>
<b>ID</b>	G-LUC-SEARCHUSER
<b>LUC_in</b>	<ul style="list-style-type: none"> <li>- Ban a User</li> <li>- Generate new access-key for CREDENTIAL Wallet</li> <li>- Recover CREDENTIAL Wallet Data</li> </ul>
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant Search Service
<b>Pre-conditions</b>	- A user identifier is known
<b>Post-conditions</b>	- The User information are available at the wallet.
<b>Description</b>	The CREDENTIAL Wallet searches for a given user.
<b>Image</b>	<pre> sequenceDiagram     actor CW1 as «System Actor» CREDENTIAL Wallet     actor PS1 as «System Actor» Participant Search Service     actor CW2 as «System Actor» CREDENTIAL Wallet     actor PS2 as «System Actor» Participant Search Service     CW1-&gt;&gt;PS1: Search Participant     </pre>

### A.2.4.8 Create De-Register CREDENTIAL account request

<b>Use Case Name</b>	<b>Create De-Register CREDENTIAL account request</b>
<b>ID</b>	G-LUC-CREATEDEREGACCREQ
<b>LUC_in</b>	Re-Register from CREDENTIAL
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	
<b>Pre-conditions</b>	- Participant wants to de-register from CREDENTIAL
<b>Post-conditions</b>	- De-register account request has been created.
<b>Description</b>	The CREDENTIAL Participant creates a de-register account request.
<b>Image</b>	

### A.2.4.9 Submit De-Register CREDENTIAL account request

<b>Use Case Name</b>	<b>Submit De-Register CREDENTIAL account request</b>
<b>ID</b>	G-LUC-SUBMITDEREGACCREQ
<b>LUC_in</b>	De-register from CREDENTIAL
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	
<b>Pre-conditions</b>	- De-Register Account Request has been created by participant - Participant is logged in on the CREDENTIAL Wallet
<b>Post-conditions</b>	- De-Register Account Request is available at the CREDENTIAL Wallet
<b>Description</b>	- The CREDENTIAL Participant's IT-System submits the de-register request to the CREDENTIAL Wallet.
<b>Image</b>	

### A.2.4.10 De-Register Account

<b>Use Case Name</b>	<b>De-Register Account</b>
<b>ID</b>	G-LUC-DEREGACC
<b>LUC_in</b>	De-Register from CREENTIAL
<b>Main Actor</b>	- CREENTIAL Wallet
<b>Secondary Actors</b>	- CREENTIAL Authorization Service - CREENTIAL Participant Search Service - CREENTIAL Participant Index - CREENTIAL Data Repository
<b>Pre-conditions</b>	- Participant requested a de-register account
<b>Post-conditions</b>	- Participant is fully de-registered from CREENTIAL Wallet
<b>Description</b>	The CREENTIAL Wallet processes the de-register account request.
<b>Image</b>	

### A.2.4.11 Create new CREDENTIAL Account Request

<b>Use Case Name</b>	<b>Create new CREDENTIAL Account Request</b>
<b>ID</b>	G-LUC-CREATECREDACCREQ
<b>LUC_in</b>	Register a new CREDENTIAL Account
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Key Generation Service - CREDENTIAL Re-Encryption Key Generation Service
<b>Pre-conditions</b>	
<b>Post-conditions</b>	- New CREDENTIAL account request has been created - Recovery Key is exported
<b>Description</b>	A User creates on his IT-System a create new CREDENTIAL account request. e.g. create private key. The IT-System uses the Key Generation Service in order to create a public/private key pair for the CREDENTIAL identity of the upcoming account. In addition, a Recovery key/pair is generated. A Re-Encryption Key from the public/private key pair to the recovery key is created. All keys are appended to the new CREDENTIAL account request.
<b>Image</b>	<pre> sequenceDiagram     actor IT as CREDENTIAL Participant's IT-System     actor KGS as CREDENTIAL Key Generation Service     actor REKGS as CREDENTIAL Re-Encryption Key Generation Service      Note over IT: Create new CREDENTIAL account request     IT-&gt;&gt;KGS: Create Keys     Note over IT: Private/Public Key pair, Recovery Keys     Note over IT: From Private/public Key pair identity to Recovery Key pair identity     IT-&gt;&gt;REKGS: Create Re-Encryption Key     Note over IT: Add Keys to new CREDENTIAL account request     Note over IT: Store Private/Public Key     Note over IT: Export Recovery key     </pre>

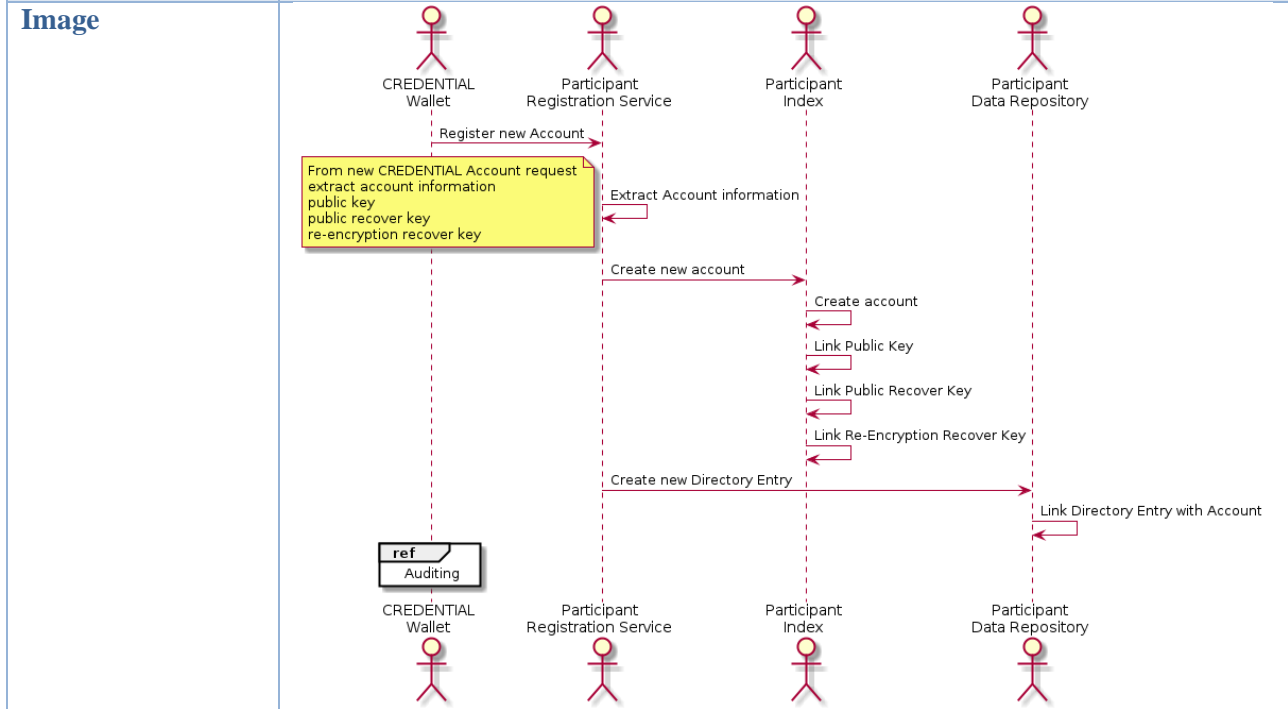

**A.2.4.12 Submit new CREDENTIAL Account Request**

<b>Use Case Name</b>	<b>Submit new CREDENTIAL Account Request</b>
<b>ID</b>	G-LUC-SUBMITCREDACCREQ
<b>LUC_in</b>	Register a new CREDENTIAL Account
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant's IT-System
<b>Pre-conditions</b>	- Participant has created a new CREDENTIAL Account request with the needed information
<b>Post-conditions</b>	- Create new Account Request is available at the CREDENTIAL Wallet
<b>Description</b>	The Participant's IT-System submits the create new CREDENTIAL Account Request to the CREDENTIAL Wallet.
<b>Image</b>	

### A.2.4.13 Create new CREDENTIAL Account

<b>Use Case Name</b>	<b>Create new CREDENTIAL Account</b>
<b>ID</b>	G-LUC-CREATECREDACC
<b>LUC_in</b>	Register a new CREDENTIAL Account
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant Index - CREDENTIAL Participant Data Repository
<b>Pre-conditions</b>	- Create a new Account Request is available at the CREDENTIAL Wallet
<b>Post-conditions</b>	- A new account is created in the CREDENTIAL Wallet
<b>Description</b>	The CREDENTIAL Wallet creates a new account. The newly created account contains of user information provided during the registration process, his public key, a public recovery key and the re-encryption recovery key. A new directory entry is created and associated with this account.

#### A.2.4.14 Create List Previous Logins Request

<b>Use Case Name</b>	<b>Create List Previous Logins Request</b>
<b>ID</b>	G-LUC-CREATELISTPREVLOGREQ
<b>LUC_in</b>	View previous logins to my account
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	
<b>Pre-conditions</b>	- Participant's identification is known
<b>Post-conditions</b>	- List Previous Logins Request is created
<b>Description</b>	The CREDENTIAL Participant's IT-System creates a list previous logins request.
<b>Image</b>	

#### A.2.4.15 Submit List Previous Logins Request

<b>Use Case Name</b>	<b>Submit List Previous Logins Request</b>
<b>ID</b>	G-LUC-SUBMITLISTPREVLOGREQUEST
<b>LUC_in</b>	View previous logins to my account
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant's IT-System
<b>Pre-conditions</b>	- Participant is allowed to view list previous logins - Participant is authenticated against the CREDENTIAL Wallet
<b>Post-conditions</b>	- List Previous Login Request is available at the CREDENTIAL Wallet
<b>Description</b>	The CREDENTIAL Participant's IT-System submits the list previous logins request to the CREDENTIAL Wallet.
<b>Image</b>	

**A.2.4.16 Query List of Previous Logins for User**

<b>Use Case Name</b>	<b>Query List of Previous Logins for User</b>
<b>ID</b>	G-LUC-QRYLISTPREVLOGINS
<b>LUC_in</b>	View previous logins to my account
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Audit Trail Service
<b>Pre-conditions</b>	- CREDENTIAL Wallet is permitted to access the list of previous logins for user - User identification is known to the CREDENTIAL Wallet
<b>Post-conditions</b>	- List of previous logins is available at the CREDENTIAL Wallet
<b>Description</b>	The CREDENTIAL Wallet queries the list of previous logins for the user based on the list previous logins request. The information is available at the audit trail service. Thus the CREDENTIAL Wallet queries this service for the needed information.
<b>Image</b>	

**A.2.4.17 Return List of Previous Logins**

<b>Use Case Name</b>	<b>Return List of Previous Logins</b>
<b>ID</b>	G-LUC-RETLISTPREVLOGINS
<b>LUC_in</b>	View previous logins to my account
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant's IT-System
<b>Pre-conditions</b>	- Participant requested a list of previous logins
<b>Post-conditions</b>	- List of previous logins is available at the Participant's IT-System
<b>Description</b>	The CREDENTIAL Wallet returns the list of previous logins to the CREDENTIAL Participant's IT-System.
<b>Image</b>	

### A.2.4.18 Create Ban a User Request

<b>Use Case Name</b>	<b>Create Ban a User Request</b>
<b>ID</b>	G-LUC-CREATEBANUSERREQ
<b>LUC_in</b>	Ban a user
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Participant Search Service - CREDENTIAL Participant Index
<b>Pre-conditions</b>	- The originator has administrator privileges - The originator is logged in as administrator - Sufficient information to uniquely identify the participant to ban is available
<b>Post-conditions</b>	- The ban a user request is created
<b>Description</b>	The CREDENTIAL Administrator creates a ban user request. The participant's identifier is searched through the Participant Search Service and Participant Index. The participant's identifier is used to create the ban a user request.
<b>Image</b>	

### A.2.4.19 Submit Ban a User Request

<b>Use Case Name</b>	<b>Submit Ban a User Request</b>
<b>ID</b>	G-LUC-SUBMITBANUSERREQ
<b>LUC_in</b>	Ban a user
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Wallet
<b>Pre-conditions</b>	- Participant has created a ban a user request - Participant is logged in as Administrator
<b>Post-conditions</b>	- Ban a user request is available at the CREDENTIAL Wallet
<b>Description</b>	The CREDENTIAL Administrator IT-System sends the ban user request to the CREDENTIAL Wallet.
<b>Image</b>	

### A.2.4.20 Ban User

<b>Use Case Name</b>	<b>Ban User</b>
<b>ID</b>	G-LUC-BANUSER
<b>LUC_in</b>	Ban a user
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant Search Service - CREDENTIAL Participant Index
<b>Pre-conditions</b>	- Wallet knows enough information to uniquely search for participant
<b>Post-conditions</b>	- Ban User flag is active in the participant's account information
<b>Description</b>	The CREDENTIAL Wallet processes the ban user requests. The participant is no longer be able to login to his account. The Wallet searches for the participant's account information. The ban user flag is activated in the participant's account information. The participant's account information is updated at the Participant Index.
<b>Image</b>	<pre> sequenceDiagram     actor Wallet as CREDENTIAL Wallet     actor Search as CREDENTIAL Participant Search Service     actor Index as CREDENTIAL Participant Index      ref Search User     Wallet-&gt;&gt;Search: Set Ban User Flag     Note over Search: User account data has a flag that indicates if the user is banned or not     Search-&gt;&gt;Index: Update user     ref Auditing     end     </pre>

**A.2.4.21 Submit Unban a User Request**

<b>Use Case Name</b>	<b>Submit Unban a User Request</b>
<b>ID</b>	G-LUC-SUBMITUNBANUSERREQ
<b>LUC_in</b>	Unban a banned User
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Wallet
<b>Pre-conditions</b>	- Participant has created a unban a user request - Participant is logged in as Administrator
<b>Post-conditions</b>	- Unban a user request is available at the CREDENTIAL Wallet
<b>Description</b>	The CREDENTIAL Administrator IT-System sends the Unban a user request to the CREDENTIAL Wallet.
<b>Image</b>	<pre> sequenceDiagram     actor Actor1 as CREDENTIAL Participant's IT-System     actor Actor2 as CREDENTIAL Wallet     Actor1-&gt;&gt;Actor2: Submit Unban a User Request     </pre> <p>The diagram illustrates the interaction between two actors: 'CREDENTIAL Participant's IT-System' and 'CREDENTIAL Wallet'. Both actors are represented by stick figures with yellow heads. A solid red arrow points from the IT-System actor to the Wallet actor, labeled 'Submit Unban a User Request'. Dashed lines connect each actor to their respective labels, which are placed above and below the actor icons.</p>

### A.2.4.22 Unban User

<b>Use Case Name</b>	<b>Unban User</b>
<b>ID</b>	G-LUC-UNBANUSER
<b>LUC_in</b>	Unban a user
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant Search Service - CREDENTIAL Participant Index
<b>Pre-conditions</b>	- Wallet knows enough information to uniquely search for participant
<b>Post-conditions</b>	- Ban User flag is deactive in the participant's account information
<b>Description</b>	The CREDENTIAL Wallet processes the unban user requests. The participant is now able to login to his account. The Wallet searches for the participant's account information. The ban user flag is deactivated in the participant's account information. The participant's account information is updated at the Participant Index.
<b>Image</b>	<pre> sequenceDiagram     actor Wallet as CREDENTIAL Wallet     actor Search as CREDENTIAL Participant Search Service     actor Index as CREDENTIAL Participant Index      Wallet-&gt;&gt;Search: Search User     activate Search     Search-&gt;&gt;Index:      activate Index     Note over Index: User account data has a flag that indicates if the user is banned or not     Index--&gt;&gt;Search:      deactivate Index     Search-&gt;&gt;Wallet: Unset Ban User Flag     deactivate Search     Wallet-&gt;&gt;Index: Update user     activate Index     deactivate Index     Note over Wallet: Auditing     </pre>

### A.2.4.23 Create Export Data Request

<b>Use Case Name</b>	<b>Create Export Data Request</b>
<b>ID</b>	G-LUC-CREATEEXPORTDATAREQ
<b>LUC_in</b>	Export data from wallet
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	
<b>Pre-conditions</b>	- Participant's identification is known
<b>Post-conditions</b>	- Export Data Request is created
<b>Description</b>	- The CREDENTIAL Participant creates an export data request.
<b>Image</b>	<pre> sequenceDiagram     actor Actor1 as CREDENTIAL Participant's IT-System     actor Actor2 as CREDENTIAL Participant's IT-System     Actor1--&gt;&gt;Actor2: Create Export Data Request     </pre>

### A.2.4.24 Submit Export Data Request

<b>Use Case Name</b>	<b>Submit Export Data Request</b>
<b>ID</b>	G-LUC-SUBEXPDATAREQ
<b>LUC_in</b>	Export data from wallet
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Wallet
<b>Pre-conditions</b>	- Participant has created an Export Data Request
<b>Post-conditions</b>	- Export data request is available at the CREDENTIAL Wallet.
<b>Description</b>	The CREDENTIAL Participant's IT-System submits the export data request to the CREDENTIAL Wallet.
<b>Image</b>	

### A.2.4.25 Return Exported Data

<b>Use Case Name</b>	<b>Return Exported Data</b>
<b>ID</b>	G-LUC-RETEXPDATA
<b>LUC_in</b>	Export data from wallet
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant's IT-System
<b>Pre-conditions</b>	- Participant requested an export data
<b>Post-conditions</b>	- Exported data is available at the Participant's IT-System
<b>Description</b>	The CREDENTIAL Wallet returns the exported data to the CREDENTIAL Participant's IT-System.
<b>Image</b>	

**A.2.4.26 Create View All Accesses Request**

<b>Use Case Name</b>	<b>Create View All Accesses Request</b>
<b>ID</b>	G-LUC-CREATEVIEWACCESSESREQ
<b>LUC_in</b>	View all accesses to my data
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	
<b>Pre-conditions</b>	- Participant identification is known to the Participant's IT-System
<b>Post-conditions</b>	- View All Accesses Request is created
<b>Description</b>	The CREDENTIAL Participant's IT-System creates a view all accesses request. He provides his participant identification (identifier or public key) in the request.
<b>Image</b>	<pre> sequenceDiagram     actor Actor1 as CREDENTIAL Participant's IT-System     actor Actor2 as CREDENTIAL Participant's IT-System     Actor1--&gt;&gt;Actor2: Create View All Accesses Request     Note over Actor1: Provides his identification     </pre>

**A.2.4.27 Submit View All Accesses Request**

<b>Use Case Name</b>	<b>Submit View All Accesses Request</b>
<b>ID</b>	G-LUC-SUBMITVIEWACCESSESREQ
<b>LUC_in</b>	View all accesses to my data
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Wallet
<b>Pre-conditions</b>	- Participant is allowed to View all accesses to his data - Participant is authenticated against the CREDENTIAL Wallet
<b>Post-conditions</b>	- View All Accesses Request is available at the CREDENTIAL Wallet
<b>Description</b>	The CREDENTIAL Participant's IT-System sends the view all accesses request to the CREDENTIAL Wallet.
<b>Image</b>	<pre> sequenceDiagram     actor Actor1 as CREDENTIAL Participant's IT-System     actor Actor2 as CREDENTIAL Wallet     Actor1-&gt;&gt;Actor2: Send View All Accesses Request     </pre>

**A.2.4.28 Search All Accesses**

<b>Use Case Name</b>	<b>Search All Accesses</b>
<b>ID</b>	G-LUC-SEARCHACCESSES
<b>LUC_in</b>	View all accesses to my data
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Authorization Service
<b>Pre-conditions</b>	- Participant identification is available at the CREDENTIAL Wallet - View all accesses is provided to the CREDENTIAL Wallet
<b>Post-conditions</b>	- A list of all accesses is available at the CREDENTIAL Wallet
<b>Description</b>	The CREDENTIAL Wallet processes the view all accesses request.
<b>Image</b>	

**A.2.4.29 Return List of All Accesses**

<b>Use Case Name</b>	<b>Return List of All Accesses</b>
<b>ID</b>	G-LUC-RETLISTALLACCESSES
<b>LUC_in</b>	View all accesses to my data
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant's IT-System
<b>Pre-conditions</b>	- Participant has requested the list of all access to his data
<b>Post-conditions</b>	- List of all access to participant's data is available at the Participant's IT-System
<b>Description</b>	The CREDENTIAL Wallet returns the list of all access to the CREDENTIAL Participant's IT-System
<b>Image</b>	

### A.2.4.30 Associate new Keypair

<b>Use Case Name</b>	<b>Associate new Keypair</b>
<b>ID</b>	G-LUC-ASSOCKEYPAIR
<b>LUC_in</b>	Generate new access-key for CREDENTIAL Wallet
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant Index
<b>Pre-conditions</b>	
<b>Post-conditions</b>	
<b>Description</b>	Once the data is re-encrypted, the participant has to be associates to his new public key, so other participant can create working re-encryption keys and it accepts operations related to the new public key pair
<b>Image</b>	<pre> sequenceDiagram     actor Wallet as «System Actor» CREDENTIAL Wallet     actor Index as «System Actor» Participant Index     Wallet-&gt;&gt;Index: Search Participant Information (old public key)     Index--&gt;&gt;Wallet: Participant Information     Wallet-&gt;&gt;Index: Register Participant Information (new public key)     </pre>

### A.2.4.31 Generate Update Re-Encryption Key

<b>Use Case Name</b>	<b>Generate Update Re-Encryption Key</b>
<b>ID</b>	G-LUC-GENUPDREENCKEY
<b>LUC_in</b>	Generate new access-key for CREDENTIAL Wallet
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Personal Trust Store - CREDENTIAL Re-Encryption Key Generation Service
<b>Pre-conditions</b>	- There is data already encrypted with the old private key - The old private key is available - There is a new keypair
<b>Post-conditions</b>	- There is a re-encryption key that allows the Wallet to re-encrypt data encrypted with the old key
<b>Description</b>	A re-encryption key is created based on the old private key of the participant and his new public key
<b>Image</b>	

### A.2.4.32 Create Re-Encryption Request

<b>Use Case Name</b>	<b>Generate Re-Encryption Request</b>
<b>ID</b>	G-LUC-GENREENCREQ
<b>LUC_in</b>	Generate new access-key for CREDENTIAL Wallet
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Sign Service - CREDENTIAL Personal Trust Store
<b>Pre-conditions</b>	- The private key currently associated to the participant is available and there is a new re-encryption key available
<b>Post-conditions</b>	
<b>Description</b>	As the participant wishes to renew its keypair it is required to re-encrypt all encrypted data stored in the wallet. The request must be signed with the old private key to ensure the validity of the request
<b>Image</b>	<pre> sequenceDiagram     actor Actor as «System Actor» CREDENTIAL Participant's IT-System     actor SignService as «System Actor» Sign Service     actor Wallet as «System Actor» CREDENTIAL Wallet      Actor-&gt;&gt;SignService: Create Re-encryption request     SignService--&gt;Actor: Sign Re-encryption request     Actor-&gt;&gt;Wallet: Submit Re-encryption request     </pre>

### A.2.4.33 Data Registration Confirmed

<b>Use Case Name</b>	<b>Data Registration Confirmed</b>
<b>ID</b>	G-LUC-DATAREGCONF
<b>LUC_in</b>	Send Data
<b>Main Actor</b>	- CREDENTIAL Wallet
<b>Secondary Actors</b>	- CREDENTIAL Participant's IT-System
<b>Pre-conditions</b>	- Participant requests a registration to CREDENTIAL
<b>Post-conditions</b>	- Participant is informed about successfully registered
<b>Description</b>	The CREDENTIAL Wallet responds with a registration confirmation to the participant.
<b>Image</b>	

### A.2.4.34 Create Recovery Request

<b>Use Case Name</b>	<b>Create Recovery Request</b>
<b>ID</b>	G-LUC-CREATERECREQ
<b>LUC_in</b>	Recover CREDENTIAL Wallet Data
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Sign Service
<b>Pre-conditions</b>	- Participant wants to recover his credentials
<b>Post-conditions</b>	- Recovery Request has been created
<b>Description</b>	A Participant want to recover his credentials for the CREDENTIAL Wallet. He creates a recovery request and signs it with his recovery key.
<b>Image</b>	

### A.2.4.35 Submit Recovery Request

<b>Use Case Name</b>	<b>Submit Recovery Request</b>
<b>ID</b>	G-LUC-SUBMITRECOVREQ
<b>LUC_in</b>	Recover CREDENTIAL Wallet Data
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Wallet
<b>Pre-conditions</b>	- Recovery Request has been created
<b>Post-conditions</b>	- Recovery Request is available at the CREDENTIAL Wallet
<b>Description</b>	A participant transmits the recovery request to the CREDENTIAL Wallet.
<b>Image</b>	

### A.2.4.36 Export Private Key

<b>Use Case Name</b>	<b>Export Private Key</b>
<b>ID</b>	G-LUC-EXPPRIVKEY
<b>LUC_in</b>	Register new device for accessing CREDENTIAL Wallet
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Personal Trust Store
<b>Pre-conditions</b>	- User has a private key for CREDENTIAL Wallet stored in his Personal Trust Store
<b>Post-conditions</b>	- Private Key is exported in an export format
<b>Description</b>	A user needs to export his private key. The key is exported in an export format.
<b>Image</b>	

### A.2.4.37 Import Private Key

<b>Use Case Name</b>	<b>Import Private Key</b>
<b>ID</b>	G-LUC-IMPPRIVKEY
<b>LUC_in</b>	Register new device for accessing CREDENTIAL Wallet
<b>Main Actor</b>	- CREDENTIAL Participant's IT-System
<b>Secondary Actors</b>	- CREDENTIAL Personal Trust Store
<b>Pre-conditions</b>	- Participant has imported a private key on his IT-System
<b>Post-conditions</b>	- Private key is imported in CREDENTIAL Personal Trust Store
<b>Description</b>	In order to use the CREDENTIAL Wallet credentials a user has to provide them in his Personal Trust Store.
<b>Image</b>	<pre> sequenceDiagram     actor User1 as User     actor User2 as User     participant IT as CREDENTIAL Participant's IT-System     participant PDS as CREDENTIAL Personal Trust Store     User1--&gt;IT     User2--&gt;PDS     IT-&gt;&gt;PDS: Import Private Key     </pre>

### A.3 Pilot domains: eGovernment, eHealth, eBusiness

#### A.3.1 eGovernment

##### A.3.1.1 Citizen asks for a contribution from Lombardy Region

<b>Use Case Name</b>	<b>Citizen asks for a contribution from Lombardy Region</b>
<b>ID</b>	E-GOV-BUC-ASKLOMBCONTRIB #250
<b>Related Generic Use Case</b>	None
<b>Main Actor</b>	- Citizen
<b>Secondary Actors</b>	- Lombardy Region - IdP selector - Lombardy Region IdP (IdPC)
<b>Pre-conditions</b>	- Antonio needs some service offered by SIAGE web site, and has his CNS smartcard and PIN
<b>Post-conditions</b>	- Antonio selects IdPC from IdP list
<b>Description</b>	A citizen, called Antonio in the related story, needs to ask for a contribution from Lombardy Region.
<b>Image</b>	

### A.3.1.2 Citizen authenticates and access to SP

<b>Use Case Name</b>	<b>Citizen authenticates and access to SP</b>
<b>ID</b>	E-GOV-BUC-AUTHSP #251
<b>Related Generic Use Case</b>	- Authenticate towards a CREENTIAL SP using CREENTIAL Wallet and a CREENTIAL-enabled IdP
<b>Main Actor</b>	- Citizen
<b>Secondary Actors</b>	- Lombardy Region IdP (IdPC) - Lombardy Region Region Service Provider - CNS - CREENTIAL proxy re-encryptio Module
<b>Pre-conditions</b>	- User has previously inserted his CNS in smartcard reader
<b>Post-conditions</b>	- User successfully access to SP
<b>Description</b>	- A citizen, called Antonio in the related story, gains an authentication from Lombardy Region IdP (IdPC) using his CNS and successfully access to the Lombardy Region Service Provider (SIAGE).
<b>Image</b>	<pre> sequenceDiagram     actor Citizen as «Human Actor» Citizen     actor CNS as «System Actor» CNS     actor IdP as «System Actor» LombardyRegionIdP     actor SP as «System Actor» LombardyRegionSP     actor Module as «System Actor» ProxyreencryptionModule      Citizen-&gt;&gt;CNS: Asks for interting CNS (services National card)     CNS-&gt;&gt;IdP: Inserts smartcard     IdP-&gt;&gt;CNS: Asks to insert 5-numbers associated PIN     CNS-&gt;&gt;IdP: Inserts PIN     IdP-&gt;&gt;CNS: Reads user's certificate     IdP-&gt;&gt;IdP: Analyse user's certificate     alt [successful case]         IdP-&gt;&gt;IdP: Certificate valid         IdP-&gt;&gt;IdP: Collects identification users data         IdP-&gt;&gt;Module: Request Proxy re-encryption keys         IdP-&gt;&gt;IdP: Encrypts data using CREENTIAL         IdP-&gt;&gt;SP: Releases a SAML 2.0 assertion         SP-&gt;&gt;IdP: Decrypts needed data using CREENTIAL         IdP-&gt;&gt;Citizen: Provides access     else [invalid certificate]         IdP-&gt;&gt;Citizen: access denied     end     </pre>

**A.3.1.3 Citizen pays some taxes using a Spain eGovernment website**

<b>Use Case Name</b>	<b>Citizen pays some taxes using a Spain eGovernment website</b>
<b>ID</b>	E-GOV-BUC-PAYTAX #252
<b>Related Generic Use Case</b>	None
<b>Main Actor</b>	- Citizen
<b>Secondary Actors</b>	- Spain - CREDENTIAL Service Provider
<b>Pre-conditions</b>	- User has the needs to pay online some taxes
<b>Post-conditions</b>	- User chooses taxes to pay online
<b>Description</b>	An Italian citizen, named Danilo in the related story, needs to pay some taxes using a Spain eGovernment website.
<b>Image</b>	

**A.3.1.4 Citizen chooses taxes to pay and try to access to SP**

<b>Use Case Name</b>	<b>Citizen chooses taxes to pay and try to access to SP</b>
<b>ID</b>	E-GOV-BUC-ACCSP #262
<b>Related Generic Use Case</b>	none
<b>Main Actor</b>	- Citizen
<b>Secondary Actors</b>	- CREDENTIAL Service Provider
<b>Pre-conditions</b>	- User has identified the tax to be paid
<b>Post-conditions</b>	- User is challenged to perform a strong authentication
<b>Description</b>	Danilo chooses the right taxes to pay and prepare to access to an authenticated area of the Spanish web site.
<b>Image</b>	<pre> sequenceDiagram     actor Citizen as «Human Actor» Lombardy Citizen in Spain     participant SPANISH_eGov as SPANISH eGov     participant System_SPP as «System Actor» Spanish Service Provider     Citizen-&gt;&gt;SPANISH_eGov: Provides a list box for the selection of taxes to be payed     Citizen-&gt;&gt;SPANISH_eGov: Selects from a list box the taxes to be payed (non-authenticated area)     Citizen-&gt;&gt;SPANISH_eGov: Sends the selected contribution     SPANISH_eGov-&gt;&gt;System_SPP: Requires authentication     System_SPP-&gt;&gt;Citizen: Requires authentication     </pre>

### A.3.1.5 Citizen performs authentication

<b>Use Case Name</b>	<b>Citizen performs authentication</b>
<b>ID</b>	E-GOV-BUC-AUTHENT #263
<b>Related Generic Use Case</b>	none
<b>Main Actor</b>	- Citizen
<b>Secondary Actors</b>	- CREDENTIAL Service Provider - IdP selector - Lombardy Region IdP (IdPC) - CNS - CREDENTIAL proxy re-encryption Module - STORK adapter
<b>Pre-conditions</b>	- User has at least one token suitable for at least one CREDENTIAL IdP
<b>Post-conditions</b>	- IdPC releases an authentication token for the user
<b>Description</b>	Danilo performs authentication using his domestic IdP.
<b>Image</b>	<p>The diagram is a UML sequence diagram titled 'Citizen performs authentication'. It features seven lifelines:          <ul style="list-style-type: none"> <li><b>Human Actor:</b> Lombardy Citizen in Spain</li> <li><b>System Actor:</b> CNS</li> <li><b>System Actor:</b> Lombardy IdPC (highlighted in green)</li> <li><b>System Actor:</b> Spanish IdP (highlighted in yellow)</li> <li><b>System Actor:</b> Spanish Service Provider (highlighted in yellow)</li> <li><b>System Actor:</b> IdP Selector</li> <li><b>System Actor:</b> Stork adapter</li> <li><b>System Actor:</b> Proxy re-encryption Module (highlighted in blue)</li> </ul>         The sequence of messages is as follows:         <ol style="list-style-type: none"> <li>Citizen requests access from CNS.</li> <li>CNS provides an IDP list to the Citizen.</li> <li><b>Alt (Lombardy IdPC):</b> IdPC selects IdPC Lombardy region and asks for an IDP list from the IdP Selector. The IdP Selector manages redirection on a foreign IdP.</li> <li><b>Alt (Spanish IdP):</b> IdPC selects Spanish IdP and asks to enable user authentication from the Spanish IdP.</li> <li>Citizen asks for entering CNS (services National card) and inserts a smartcard.</li> <li>Citizen asks to insert 5-numbers associated PIN and inserts the PIN.</li> <li>IdPC reads the user's certificate and analyzes it.</li> <li><b>Alt (Lombardy IdPC selected):</b> IdPC checks if the certificate is valid, collects user data, requests proxy re-encryption keys from the Proxy re-encryption Module, encrypts data using CREDENTIAL, and releases a SAML 2.0 assertion to the Spanish Service Provider. The Service Provider then decrypts the data using CREDENTIAL and provides access. If the certificate is invalid, access is denied.</li> <li><b>Alt (Spanish IdP selected):</b> IdPC checks if the certificate is valid, collects user data, requests proxy re-encryption keys from the Proxy re-encryption Module, encrypts data using CREDENTIAL, and releases a SAML 2.0 assertion to the Spanish Service Provider. The Service Provider then decrypts the data using CREDENTIAL and provides access. If the certificate is invalid, access is denied.</li> </ol> </p>

### A.3.1.6 Citizen pays taxes on Spanish eGovernment website

<b>Use Case Name</b>	<b>Citizen pays taxes on Spanish eGovernment website</b>
<b>ID</b>	E-GOV-BUC-COMLETEPAYM #264
<b>Related Generic Use Case</b>	- Proxy Re-Encryption
<b>Main Actor</b>	- Citizen
<b>Secondary Actors</b>	- CREDENTIAL Service Provider - CREDENTIAL Wallet - CREDENTIAL proxy re-encryption Module
<b>Pre-conditions</b>	- User has been successfully authenticated by an IdP
<b>Post-conditions</b>	- User successfully access to SP
<b>Description</b>	After a successful authentication, Italian citizen is ready to pay taxes in the Spanish eGovernment website.
<b>Image</b>	<p>The diagram illustrates the process flow for a citizen paying taxes. It involves three main components: the Citizen (Human Actor), SPANISH eGov (System Actor), and CREDENTIAL WALLET (System Actor). The process starts with the citizen being successfully authenticated through an IDP. The citizen then adds identity data (Spanish address and NIF) to the SPANISH eGov. The SPANISH eGov grants access to the payment service. The citizen pays taxes, and the SPANISH eGov requests re-encryption of new data stored in the CREDENTIAL WALLET. The CREDENTIAL WALLET performs an additional data re-encryption process and makes the new data available to the SPANISH eGov.</p>

**A.3.1.7 Foreign citizen looks for a contribution from Lombardy Region**

<b>Use Case Name</b>	<b>Foreign citizen looks for a contribution from Lombardy Region</b>
<b>ID</b>	E-GOV-BUC-FOREIGNASKCONTRIB #265
<b>Related Generic Use Case</b>	
<b>Main Actor</b>	- Citizen
<b>Secondary Actors</b>	- Lombardy Region Service Provider - Lombardy Region
<b>Pre-conditions</b>	- User has a contribution need
<b>Post-conditions</b>	- User finds an appropriate contribution on SIAGE
<b>Description</b>	A foreign citizen living in Italy, named Cristiano in the related story, needs a contribution from Lombardy Region.
<b>Image</b>	<pre> sequenceDiagram     actor H1 as «Human Actor» Spanish Citizen in Lombardy     actor S1 as «System Actor» Lombardy Region SP SIAGE     actor H2 as «Human Actor» Spanish Citizen in Lombardy     actor S2 as «System Actor» Lombardy Region SP SIAGE      H1-&gt;&gt;S1: Access to non-authenticated SIAGE web site     S1--&gt;&gt;H1: Provides info about available contributions     H1-&gt;&gt;S1: Chooses the appropriate contribution     H1-&gt;&gt;S1: Sends the selected choice for contribution     S1--&gt;&gt;H1: Requires authentication     </pre>

### A.3.1.8 Citizen gains on-line authentication

<b>Use Case Name</b>	<b>Citizen gains on-line authentication</b>
<b>ID</b>	E-GOV-BUC-FOREIGNAUTH #284
<b>Related Generic Use Case</b>	- Authentication towards a CREDENTIAL SP using CREDENTIAL Wallet and a IdP
<b>Main Actor</b>	- Citizen
<b>Secondary Actors</b>	- IdP selector - Spanish IdP - CREDENTIAL proxy re-encryptio Module - STORK adapter
<b>Pre-conditions</b>	- User has previously choose a contribution request on SIAGE
<b>Post-conditions</b>	- User gets authentication from Spanish IdP
<b>Description</b>	A strong authentication is required from SIAGE prior to the request is submitted by the user.
<b>Image</b>	<pre> sequenceDiagram     actor Citizen as «Human Actor» Spanish Citizen in Lombardy     participant SIAGE as «System Actor» Lombardy Region SP SIAGE     participant IdPSelector as «System Actor» IdPSelector     participant StorkAdapter as «System Actor» Stork Adapter     participant SpanishIdP as «System Actor» Spanish IdP     participant CREDENTIAL as «System Actor» ProxyreencryptionModule      Citizen-&gt;&gt;SIAGE: Asks for IDP list     SIAGE--&gt;&gt;Citizen: Provides IDP list     Citizen-&gt;&gt;SIAGE: Selects Spanish IdP     SIAGE-&gt;&gt;IdPSelector: Asks for IDP list     IdPSelector-&gt;&gt;StorkAdapter: Manages redirection on foreign IdP     StorkAdapter-&gt;&gt;SpanishIdP: Asks to enable user authentication     Citizen-&gt;&gt;SIAGE: Asks for username, password and OTP generated by mobile APP     SIAGE-&gt;&gt;SpanishIdP: Provides the required user's credentials     SpanishIdP-&gt;&gt;CREDENTIAL: Analyzes provided users' credentials     CREDENTIAL--&gt;&gt;SpanishIdP: User's credentials are valid     SpanishIdP-&gt;&gt;CREDENTIAL: Collects identification users data     CREDENTIAL-&gt;&gt;SpanishIdP: Request Proxy re-encryption keys     SpanishIdP-&gt;&gt;CREDENTIAL: Encrypts data using CREDENTIAL     CREDENTIAL-&gt;&gt;SIAGE: releases a SAML 2.0 assertion     SIAGE-&gt;&gt;Citizen: Provides access     SIAGE-&gt;&gt;CREDENTIAL: Decrypts needed data using CREDENTIAL      alt [successful case]         SIAGE-&gt;&gt;Citizen: Provides access     else [invalid user's credentials]         SIAGE--&gt;&gt;Citizen: access denied     end     </pre>

### A.3.1.9 Citizen completes online request to SIAGE

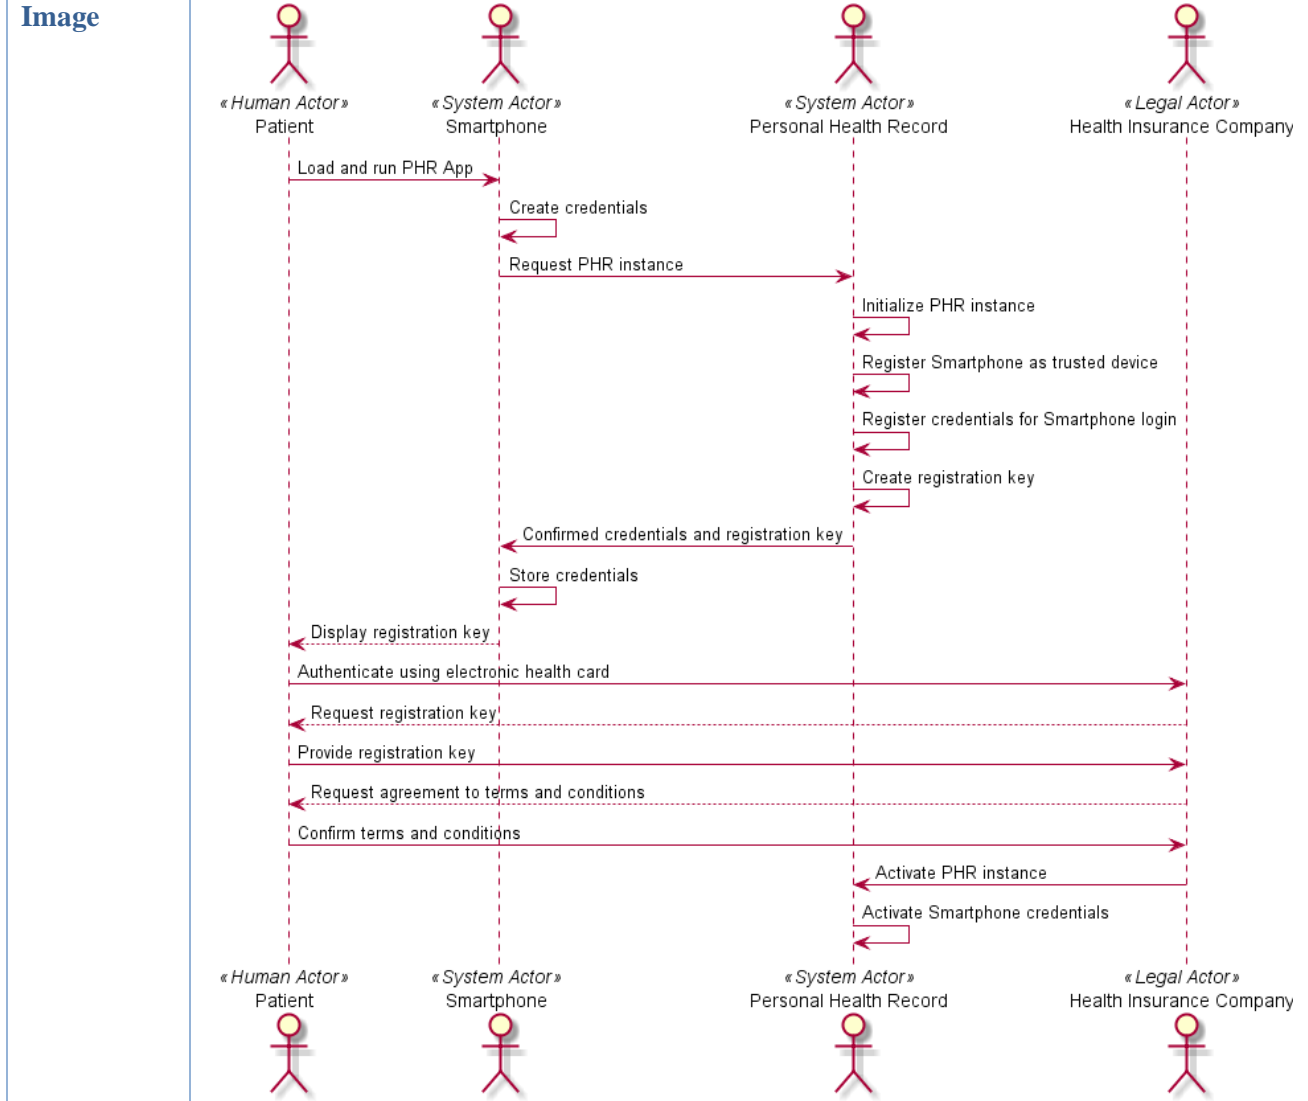

<b>Use Case Name</b>	<b>Citizen completes online request to SIAGE</b>
<b>ID</b>	E-GOV-BUC-FOREIGNCOMPLCONTRIB #287
<b>Related Generic Use Case</b>	<ul style="list-style-type: none"> <li>- Selective Disclosure</li> <li>- Proxy re-encryption</li> </ul>
<b>Main Actor</b>	- Citizen
<b>Secondary Actors</b>	<ul style="list-style-type: none"> <li>- Lombardy Region Service Provider</li> <li>- CREDENTIAL Wallet</li> <li>- CREDENTIAL proxy re-encryption Module</li> </ul>
<b>Pre-conditions</b>	- User has been successfully authenticated by IdP
<b>Post-conditions</b>	- User is logged into SP
<b>Description</b>	Adriano can now access to SIAGE in order to submit the needed contribution request.
<b>Image</b>	<p>The diagram illustrates the process flow for a citizen submitting a contribution request. It features three main areas: a Human Actor (Spanish Citizen in Lombardy), a System Actor (Lombardy Region SP SIAGE), and a System Actor (CREDENTIAL system). The CREDENTIAL system is further divided into ProxyreencryptionModule and AttributeService.</p> <p>The sequence of interactions is as follows:</p> <ol style="list-style-type: none"> <li>The Human Actor provides access to the contribution request to the Lombardy Region SP SIAGE.</li> <li>The Lombardy Region SP SIAGE needs a Fiscal Code and asks for it from the Human Actor.</li> <li>The Human Actor provides the Fiscal code from the CREDENTIAL Wallet to the Lombardy Region SP SIAGE.</li> <li>The Lombardy Region SP SIAGE decrypts the Fiscal code using CREDENTIAL.</li> <li>The Lombardy Region SP SIAGE asks the ProxyreencryptionModule for Proxy re-encryption.</li> <li>The ProxyreencryptionModule provides Proxy re-encryption to the Lombardy Region SP SIAGE.</li> <li>The Lombardy Region SP SIAGE fills in the complete form for "Child's school contribution" and submits the contribution request to the Human Actor.</li> </ol>

## A.3.2 eHealth

### A.3.2.1 Setup and Configure PHR

Use Case Name	Setup and Configure PHR
<b>ID</b>	E-HEA-BUC-SETUPCONFPHR
<b>Related Generic Use Case</b>	none
<b>Main Actor</b>	- Personal Health Record (PHR)
<b>Secondary Actors</b>	- Patient - Health Insurance Company - Smartphone
<b>Pre-conditions</b>	- The patient's statutory health insurance is operating a PHR platform for its customers/members. - The patient fulfills the health insurance's conditions for subscribing to the PHR platform. - The patient holds credentials that allow the health insurance company to univocally identify him and securely authenticate him.
<b>Post-conditions</b>	- A shared Personal Health record (PHR) has been set up and is ready for collecting and sharing medical data about the patient. - The patient has signed the PHR provider's terms and conditions and is aware about how to use the various services the PHR platform offers. - As the owner of his PHR the patient is given all tokens/credentials he needs for securely interacting with the PHR and for granting permissions to other actors. - The patient's Smartphone is registered as a trusted device with the PHR.
<b>Description</b>	The patient downloads the PHR App and installs it on his Smartphone. Through a handshake between the PHR and the Smartphone, his Smartphone gets registered as a trusted device for interacting with the PHR. The patient identifies and authenticates himself with his health insurance company through the company's web portal. He provides a link to his newly created PHR instance and requests the health insurance company for accepting all related costs within a specific patient compliance program. After agreeing to the terms and conditions for using a PHR and for participating in the compliance program, the previously set up PHR instance is activated through the health insurance company.

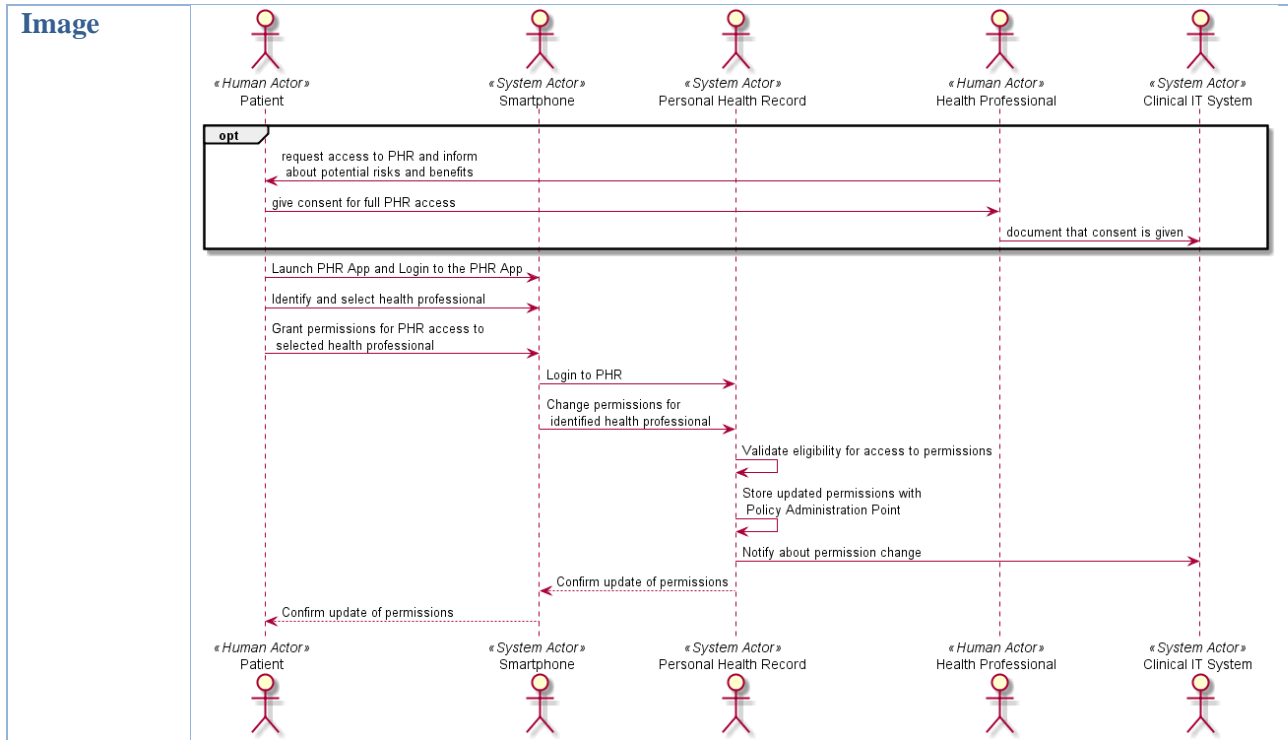

### A.3.2.2 Grant Permission

Use Case Name	Grant Permission
<b>ID</b>	E-HEA-BUC-GRANDPERM
<b>Related Generic Use Case</b>	Grant Access Rights
<b>Main Actor</b>	- Personal Health Record (PHR)
<b>Secondary Actors</b>	- Patient - Health Professional - Smartphone
<b>Pre-conditions</b>	- A shared Personal Health record (PHR) has been set up for collecting and sharing medical data - The patient is equipped with a Smartphone that has been registered as a trusted device with the PHR - The patient has been advised and trained in interacting with the PHR - The patient is able to identify the health professional he wants to authorize for accessing his PHR
<b>Post-conditions</b>	- A health professional is granted CRUD (create, read, update, delete) permissions for accessing the patient's PHR - The health professional is informed about the authorization and provided with all information he needs for securely connecting to the patient's PHR.
<b>Description</b>	<p>The patient gives informed consent to a health professional for accessing his PHR. Depending on national legislation this consent may either be given on paper, orally or implicitly by granting permissions for PHR access to the physician. In any case the patient needs to register the permissions given through the consent with the PHR using his smartphone:</p> <ul style="list-style-type: none"> <li>- The patient launches the PHR app on his smartphone and connects to the PHR</li> <li>- The patient identifies the health professional by using respective directory services which are provided through the PHR app on his smartphone</li> <li>- The patient states that the selected health professional is allowed to provide data to the PHR and to read data from the PHR. A default value for the validity time of the permission is set which can be overwritten by the patient during this step.</li> </ul> <p>After the authorization of the health professional is registered with the PHR, the PHR sends a respective notification to the health professional.</p>

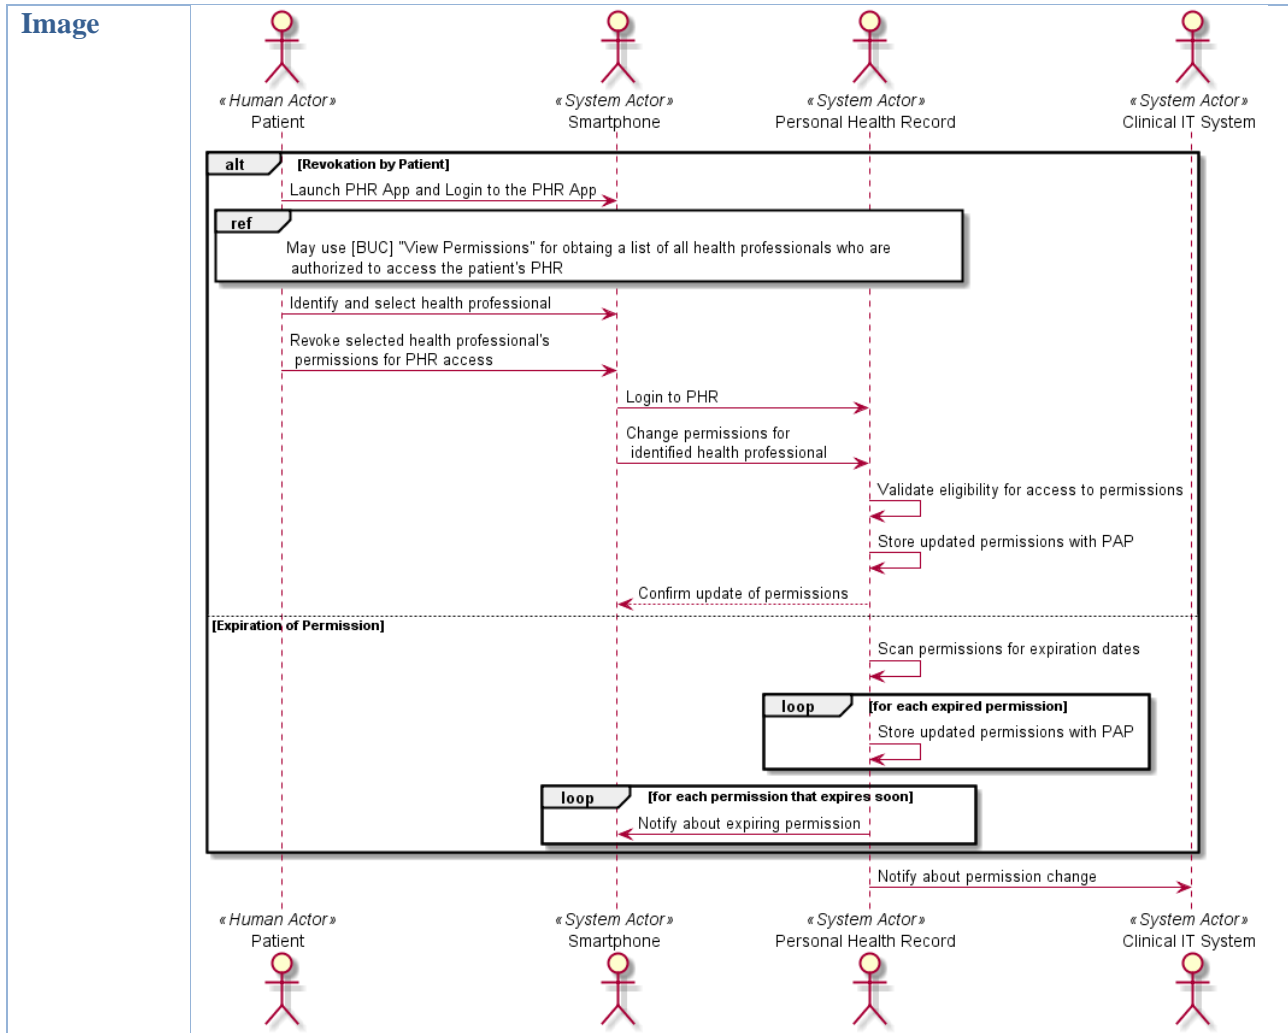

### A.3.2.3 Revoke Permission

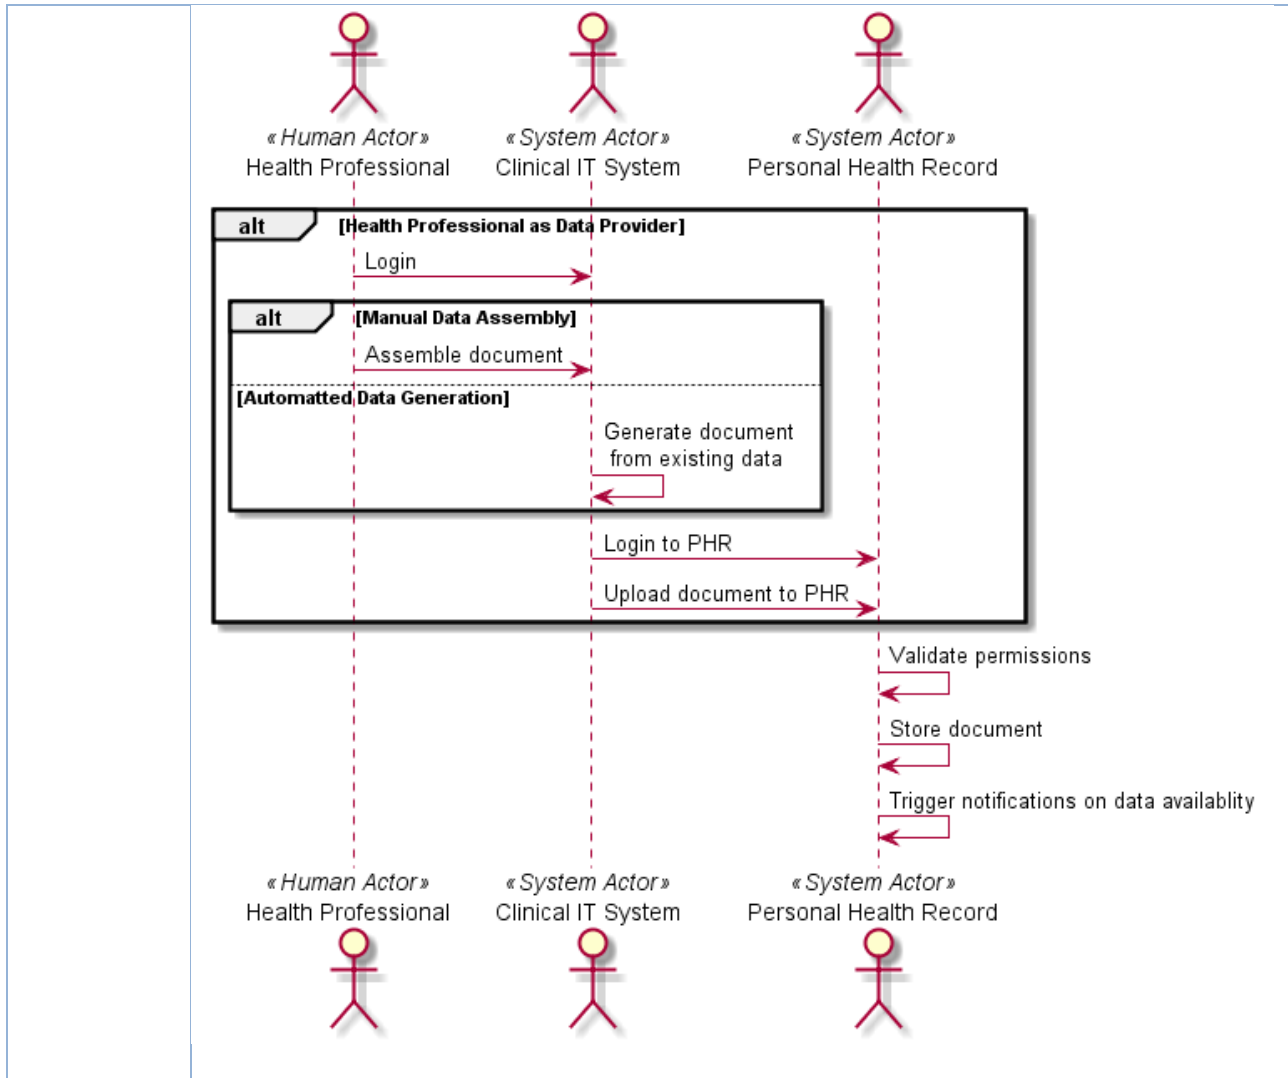

Use Case Name	Revoke Permission
<b>ID</b>	E-HEA-BUC-REVOKEPERM
<b>Related Generic Use Case</b>	Grant Access Rights
<b>Main Actor</b>	- Personal Health Record (PHR)
<b>Secondary Actors</b>	- Patient - Health Professional - Smartphone
<b>Pre-conditions</b>	- A shared Personal Health record (PHR) has been set up for collecting and sharing medical data - The patient is equipped with a Smartphone that has been registered as a trusted device with the PHR - The patient has been advised and trained in interacting with the PHR - The Health professional has been granted access rights to the PHR by the patient
<b>Post-conditions</b>	- Formerly granted permissions to a health professional are revoked. The health professional is no longer able to access the patient's PHR - The health professional is informed about the revocation of permissions.
<b>Description</b>	<p>Granted permissions can get revoked either explicitly by the patient or implicitly by reaching their expiration date.</p> <p>Explicit Revocation:</p> <ul style="list-style-type: none"> <li>- The patient launches the PHR app on his smartphone and connects to the PHR.</li> <li>- The patient identifies the health professional whose permissions are to be revoked.</li> <li>- The patient states that the selected health professional is no longer allowed to provide data to the PHR or to read data from the PHR.</li> <li>- The affected health professional gets informed about the revocation of permissions.</li> </ul> <p>Implicit Revocation:</p> <ul style="list-style-type: none"> <li>- The PHR regularly scans all permissions for their expiration dates.</li> <li>- If an expired permission is detected, the respective access rights are revoked and a notification is sent to the patient and the affected health professional</li> </ul>

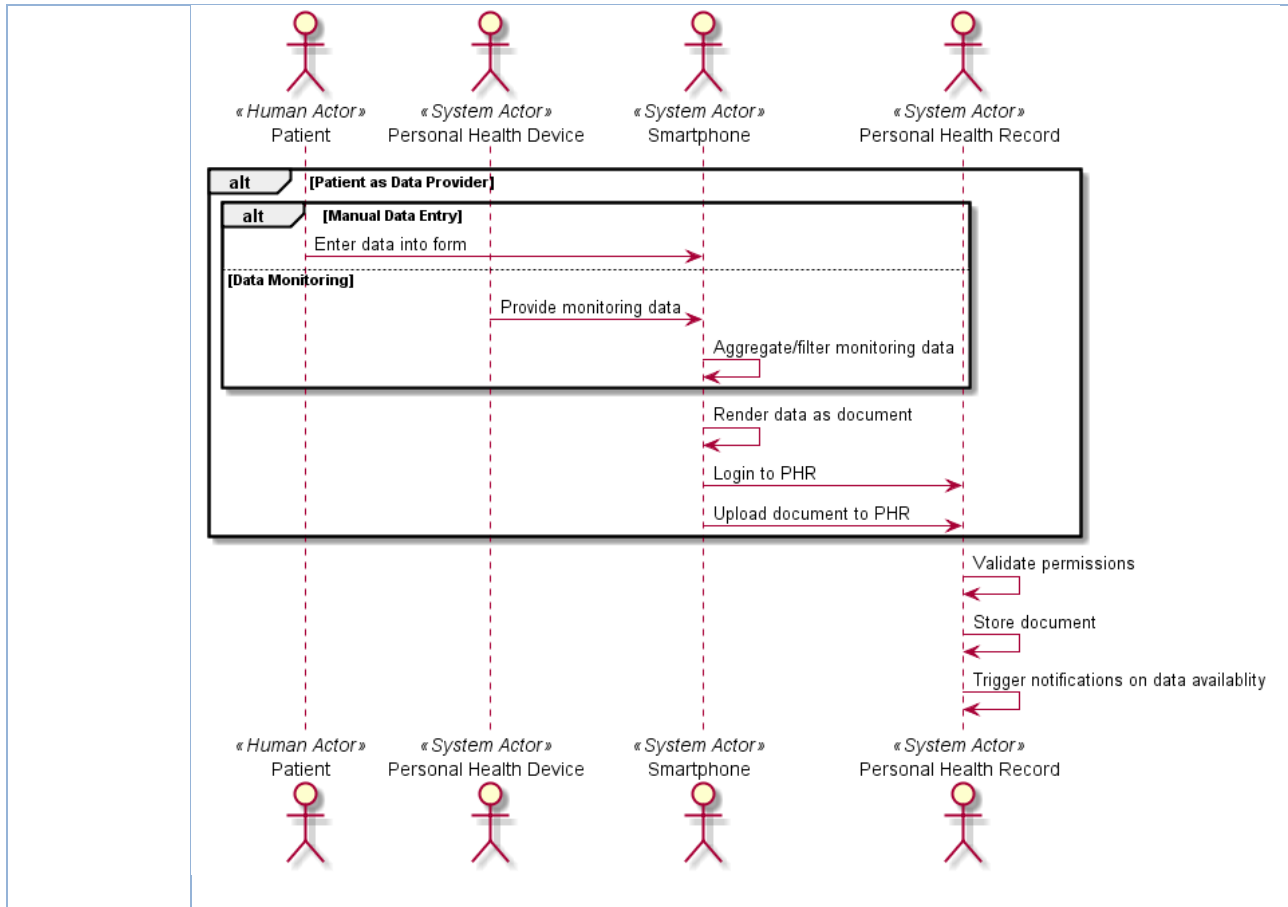

**A.3.2.4 Send (Medical) Data**

<b>Use Case Name</b>	<b>Send (Medical) Data</b>
<b>ID</b>	E-HEA-BUC-SENDMEDDATA
<b>Related Generic Use Case</b>	Send Data
<b>Main Actor</b>	- Personal Health Record (PHR)
<b>Secondary Actors</b>	- Patient - Health Professional - Personal Health Device - Smartphone - Clinical IT System
<b>Pre-conditions</b>	- A shared Personal Health record (PHR) has been set up for collecting and sharing medical data - The patient is equipped with a smartphone that has been registered as a trusted device with the PHR - The patient has been advised and trained in interacting with the PHR - If data is to be provided by a health professional: The health professional has been granted access rights to the PHR by the patient - If data is to be provided through a personal health device: The personal health device is paired with the patient’s smartphone
<b>Post-conditions</b>	- New data is stored in the patient’s PHR - Authorized PHR users are able to access this data - Notifications on data availability are triggered
<b>Description</b>	New data can be stored in a PHR from four different sources: <ol style="list-style-type: none"> <li>1. A healthcare professional assembles a new document at his clinical IT system and provides it to the patient’s PHR</li> <li>2. The healthcare professional’s clinical IT system regularly and automatically renders a document from existing data and uploads it to the patient’s PHR</li> <li>3. The patient provides data to the PHR through an interactive form or any other data capturing service on his smartphone</li> <li>4. A personal health device regularly monitors data of the patient. The patient’s smartphone accepts this data, aggregates/filters it through an app that came with the personal health device and upload the data to the patient’s PHR</li> </ol> <p>All alternatives require that the data sender is authenticated and authorized with the PHR. Ideally authentication relies on the principle of brokered trust so that the PHR accepts a formerly done authentication to a trusted device/environment.</p> <p>Whenever new data is uploaded to the PHR a notification is triggered and send to all authorized users (see BUC “Read (Medical) Data” on how this is processed).</p>
<b>Image</b>	For reasons of readability alternatives 1+2 and 3+4 are shown in separate figures.

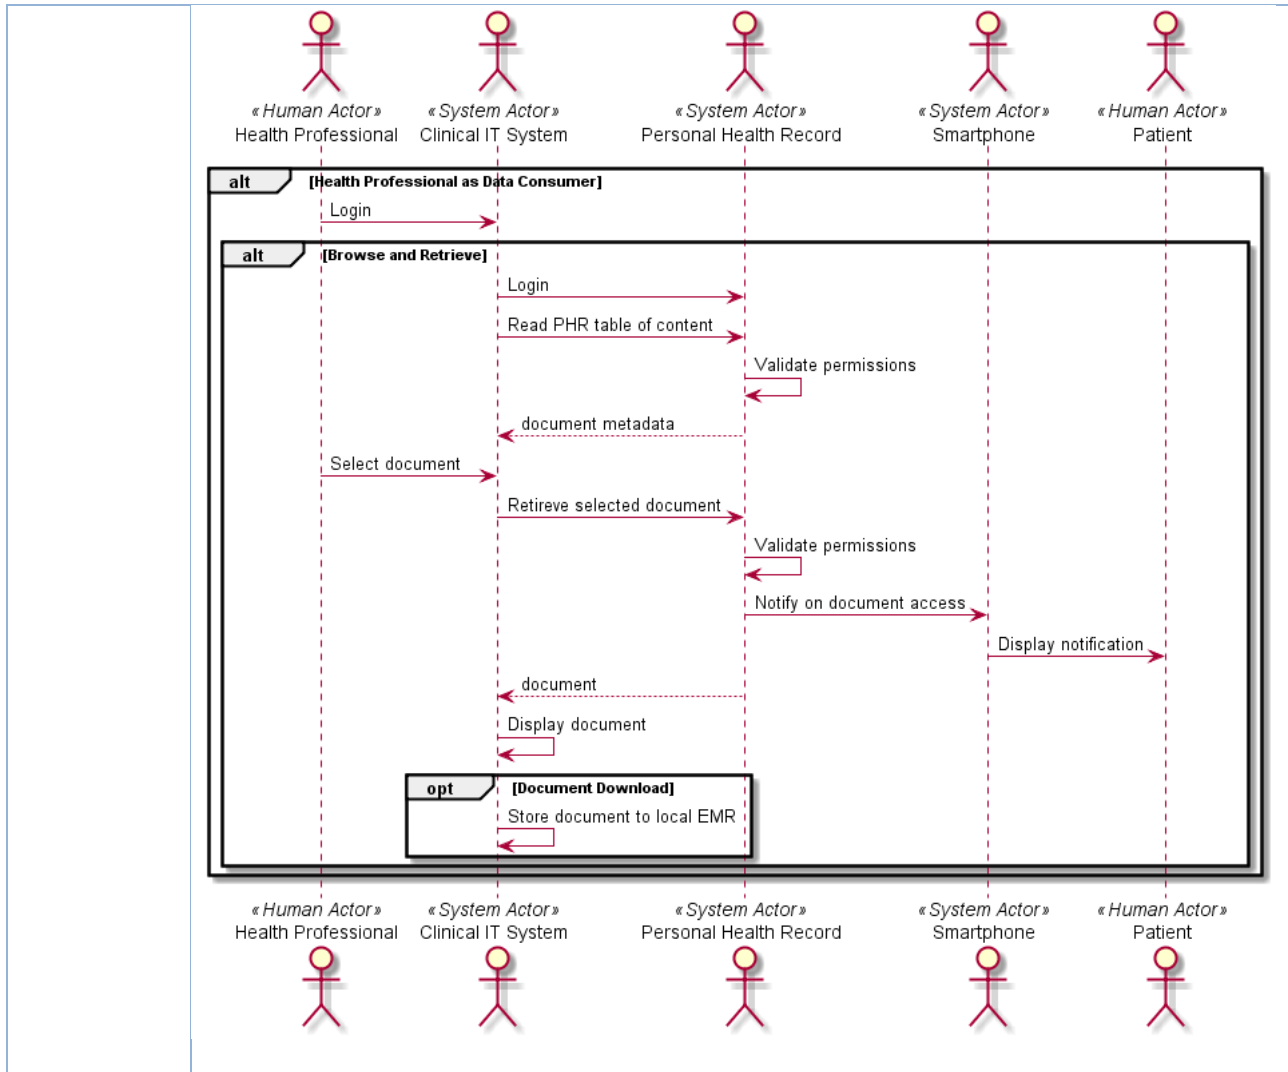

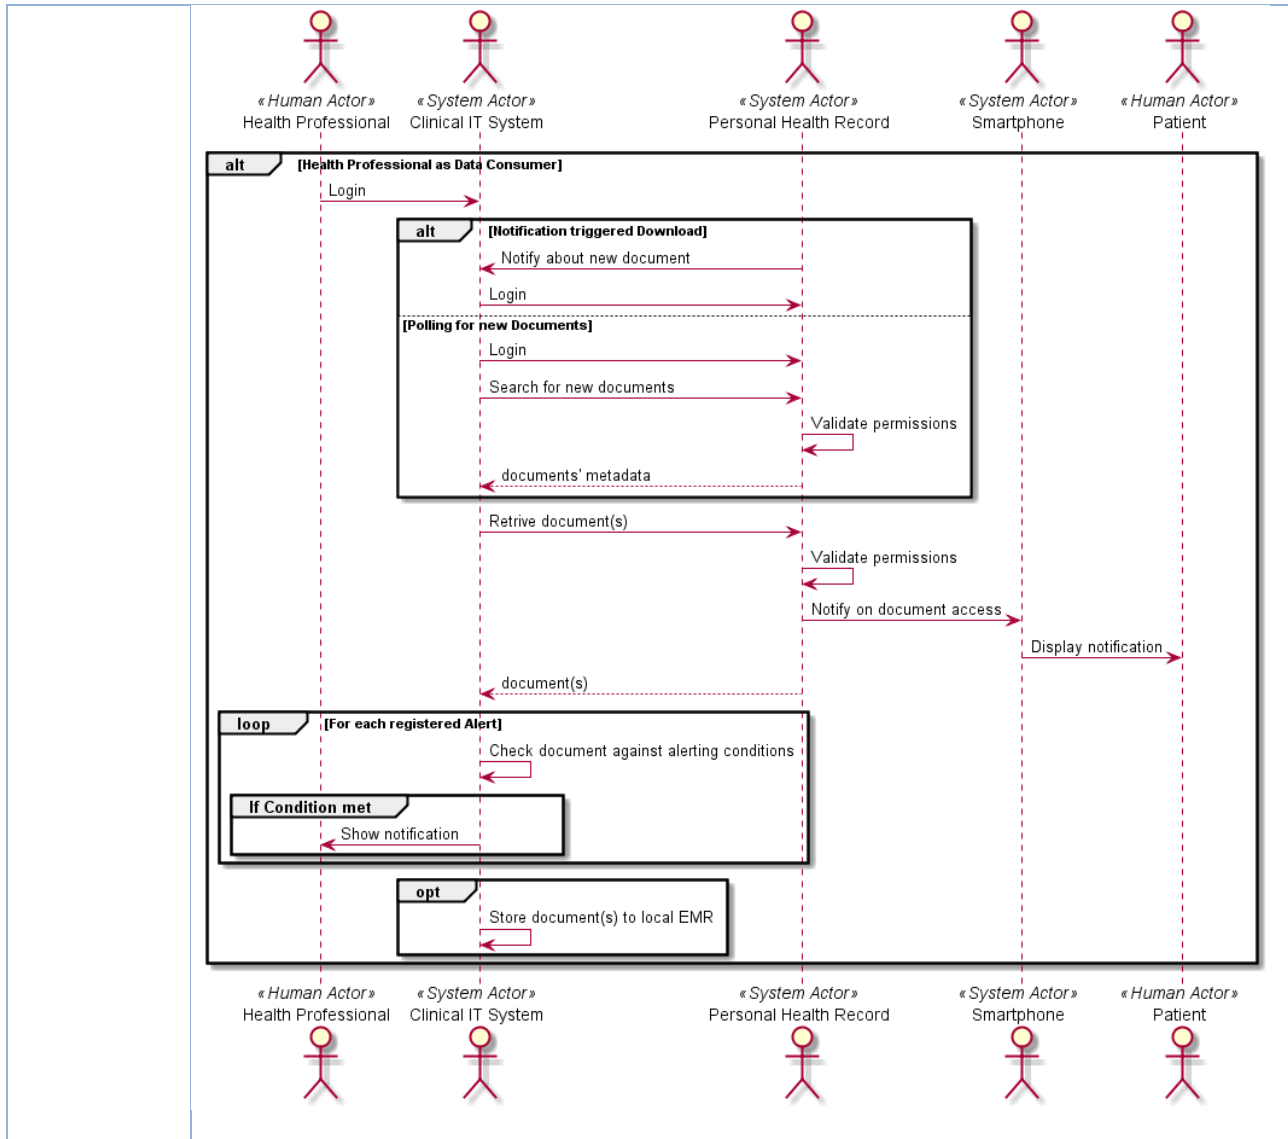

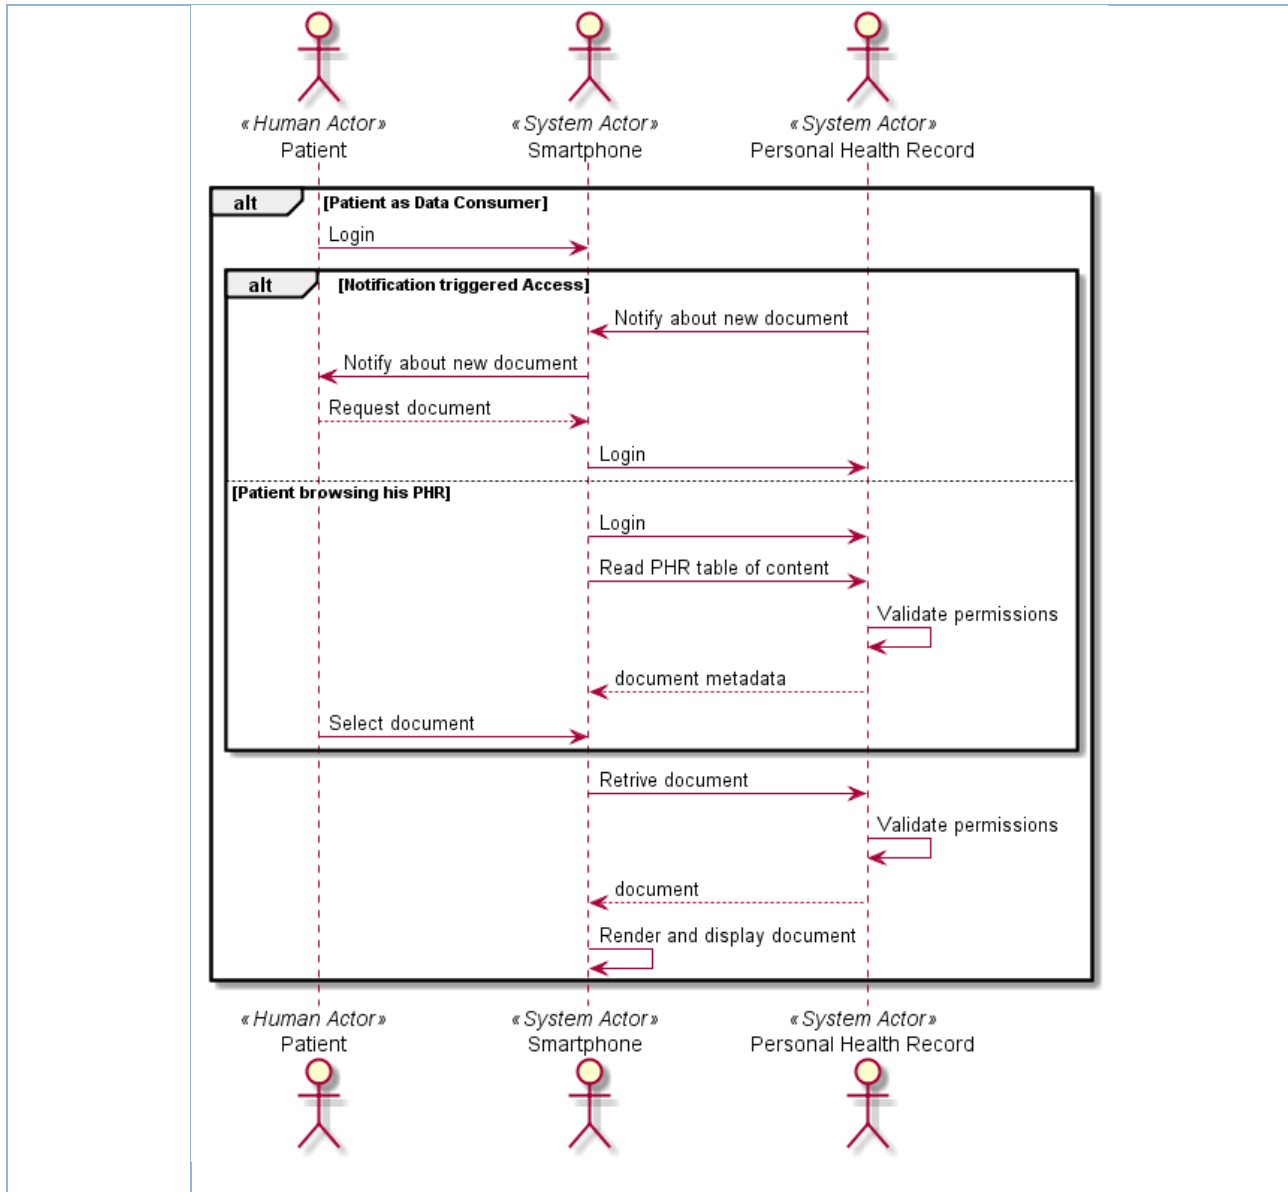

**A.3.2.5 Read (Medical) Data**

<b>Use Case Name</b>	<b>Read (Medical) Data</b>
<b>ID</b>	E-HEA-BUC-READMEDDATA
<b>Related Generic Use Case</b>	Read Data
<b>Main Actor</b>	- Personal Health Record (PHR)
<b>Secondary Actors</b>	- Patient - Health Professional - Personal Health Device - Smartphone - Clinical IT System
<b>Pre-conditions</b>	- A shared Personal Health record (PHR) has been set up for collecting and sharing medical data - The patient is equipped with a smartphone that has been registered as a trusted device with the PHR - The patient has been advised and trained in interacting with the PHR - If data is to be accessed by a health professional: The health professional has been granted access rights to the PHR by the patient
<b>Post-conditions</b>	- Data is read from the patient’s PHR and may be stored by the user for further processing - A notification has been sent to the patient that a health professional accessed his medical data
<b>Description</b>	<p>Data can be read from a PHR in five different ways:</p> <ol style="list-style-type: none"> <li>1. A healthcare professional browses the patient’s PHR and opens selected documents. These documents may then be downloaded into the health professional’s clinical IT system.</li> <li>2. A healthcare professional’s IT system receives a notification about new data available and downloads the document for local visualization and processing.</li> <li>3. The healthcare professional’s clinical IT system regularly polls the patient’s PHR for new data and automatically downloads the document for local visualization and processing.</li> <li>4. The patient logs into his own PHR via his smartphone and oversees the data available. He visualizes selected documents.</li> <li>5. The patient’s smartphone receives a notification about new data available and notifies the patient about this. The patient oversees the document on his smartphone.</li> </ol> <p>All alternatives require that the data user is authenticated and authorized with the PHR. Ideally authentication relies on the principle of brokered trust so that the PHR accepts a formerly done authentication to a trusted device/environment.</p> <p>Alternatives 2 and 3 may be used in conjunction with registered alerts (see BUC “Register Alert”). In this case each new document is assessed if it matches specific rules which were defined as alerting conditions. If an alerting condition is met, a respective notification is shown to the healthcare professional.</p> <p>In each scenario where a health professional accesses a patient’s PHR data, a respective notification is sent to the patient via his smartphone.</p>
<b>Image</b>	For reasons of readability alternatives 1, 2+3 and 4+5 are shown in separate figures.

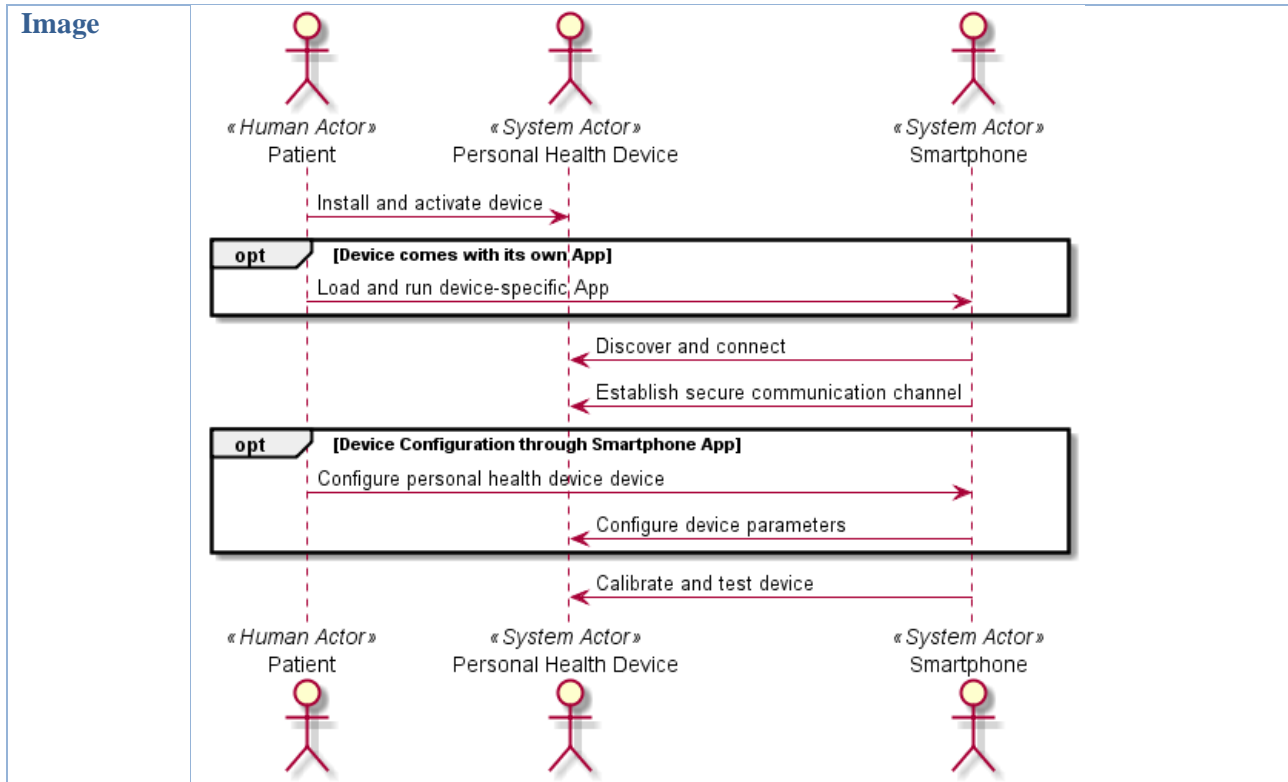

### A.3.2.6 Personal Health Device Pairing

<b>Use Case Name</b>	<b>Personal Health Device Pairing</b>
<b>ID</b>	E-HEA-BUC-PERSHEALTHDEVPAIR
<b>Related Generic Use Case</b>	none
<b>Main Actor</b>	- Patient's IT-System
<b>Secondary Actors</b>	- Patient - Personal Health Device
<b>Pre-conditions</b>	- A shared Personal Health record (PHR) has been set up for collecting and sharing medical data - The patient is equipped with a Smartphone that has been registered as a trusted device with the PHR - The patient has been advised and trained in interacting with the PHR - The patient is given one or more personal health devices that shall provide monitoring data to the PHR
<b>Post-conditions</b>	- A personal health device is paired with the patient's smartphone such that both devices can securely share data - The smartphone is equipped and configured to forward (filtered and aggregated) monitoring data to the PHR
<b>Description</b>	<p>Each personal health device given to the patient (e. g. glucometer) needs to be paired with the patient's smartphone which takes the roles of</p> <ul style="list-style-type: none"> <li>- an application hosting device that runs a service (App) for administrating the personal health device and for securely accepting monitoring data that was collected by this device</li> <li>- a personal hub that securely transmits monitoring data to the patient's PHR.</li> </ul> <p>For CREDENTIAL we assume that each personal health device either comes with a dedicated smartphone app or can be connected to an existing health app (e. g. Apple Health or Google Fit). This app provides all means for discovering the device, connecting to the device and accepting data from the device. Additional functionality such as local data processing and data visualization may be provided by this App but will not be considered for CREDENTIAL.</p> <p>By this pairing of a personal health device and a smartphone almost only consists of downloading the device-specific App and then using the configuration means of this App for establishing a secure connection between the health device and the smartphone.</p>

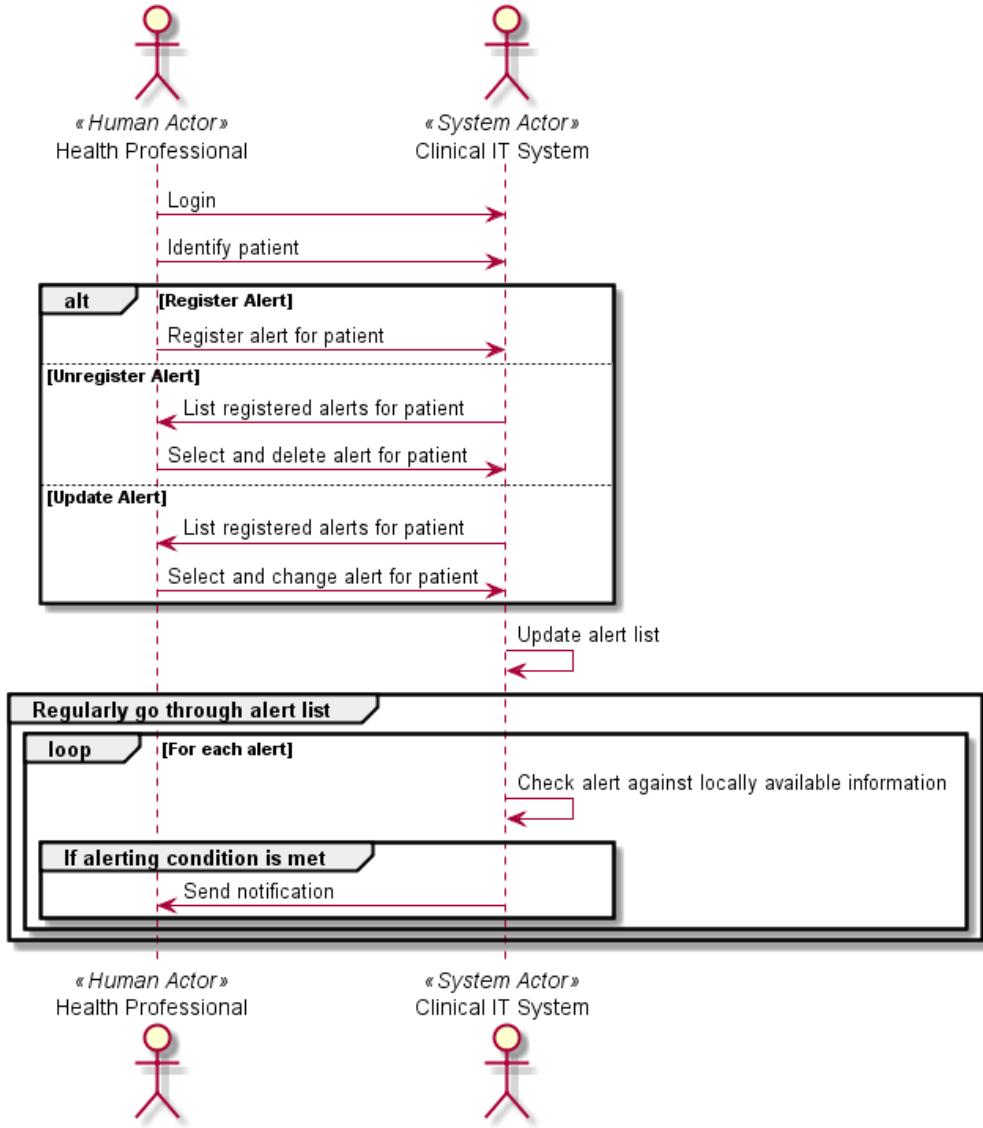

**A.3.2.7 Register Alert**

<b>Use Case Name</b>	<b>Register Alert</b>
<b>ID</b>	E-HEA-BUC-REGALERT
<b>Related Generic Use Case</b>	none
<b>Main Actor</b>	- Clinical IT System
<b>Secondary Actors</b>	- Health Professional
<b>Pre-conditions</b>	- A shared Personal Health record (PHR) has been set up for collecting and sharing medical data - The health professional has been granted access rights to the PHR by the patient
<b>Post-conditions</b>	- An alert is registered, unregistered or updated with the health professional’s clinical IT system - A notification is send to the health professional whenever a new document provided to the PHR meets the defined alerting condition
<b>Description</b>	A health professional may register alerts with his clinical IT system for triggering a notification whenever a document newly provided to a patient’s PHR meets a defined condition. As alerts may as well be registered for the absence of expected events (e. g. a requested lab report is not available within a defined time frame) the health professional’s clinical IT system will regularly go through all defined alerts in order to catch such conditions, too.

Image

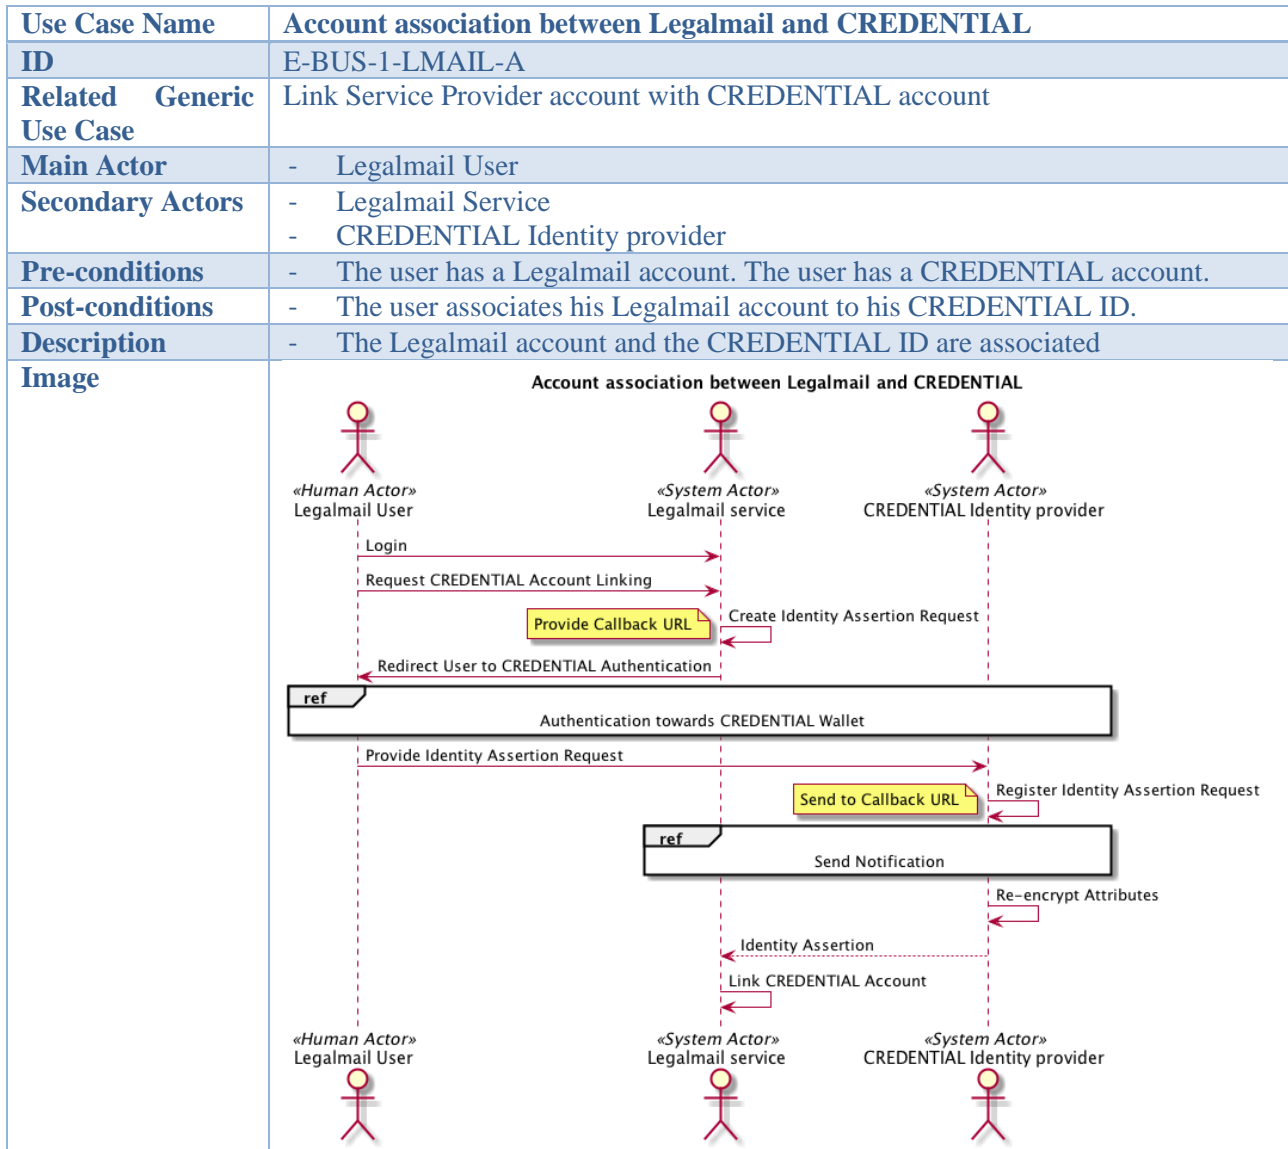

### A.3.2.8 View Permissions

<b>Use Case Name</b>	<b>View Permissions</b>
<b>ID</b>	E-HEA-BUC-VIEWPERM
<b>Related Generic Use Case</b>	none
<b>Main Actor</b>	- Personal Health Record (PHR)
<b>Secondary Actors</b>	- Patient - Smartphone
<b>Pre-conditions</b>	- A shared Personal Health record (PHR) has been set up for collecting and sharing medical data - The patient is equipped with a Smartphone that has been registered as a trusted device with the PHR - The patient has been advised and trained in interacting with the PHR
<b>Post-conditions</b>	-
<b>Description</b>	In order to properly manage his PHR the patient shall be able to oversee what permissions had been granted to which health professionals. As the patient's PHR is the single source of truth for managing all permissions, the patient needs to login to the PHR through his smartphone. The smartphone receives a structured document from the PHR that provides full information on all granted permissions.
<b>Image</b>	<pre> sequenceDiagram     actor Patient as «Human Actor» Patient     actor Smartphone as «System Actor» Smartphone     actor PHR as «System Actor» Personal Health Record      Patient-&gt;&gt;Smartphone: Launch PHR App and Login to the PHR App     Patient-&gt;&gt;Smartphone: Request overview on given permissions     Smartphone-&gt;&gt;PHR: Login to PHR     Smartphone-&gt;&gt;PHR: Request overview on given permissions     activate PHR     PHR-&gt;&gt;PHR: Validate eligibility for access to permissions     PHR-&gt;&gt;PHR: Render permissions as structured document     PHR--&gt;&gt;Smartphone: Document     deactivate PHR     Smartphone-&gt;&gt;Smartphone: Render structured document for display     Smartphone--&gt;&gt;Patient: Display given permissions     </pre>

### A.3.3 eBusiness

#### A.3.3.1 Set up login to Legalmail by using CREDENTIAL

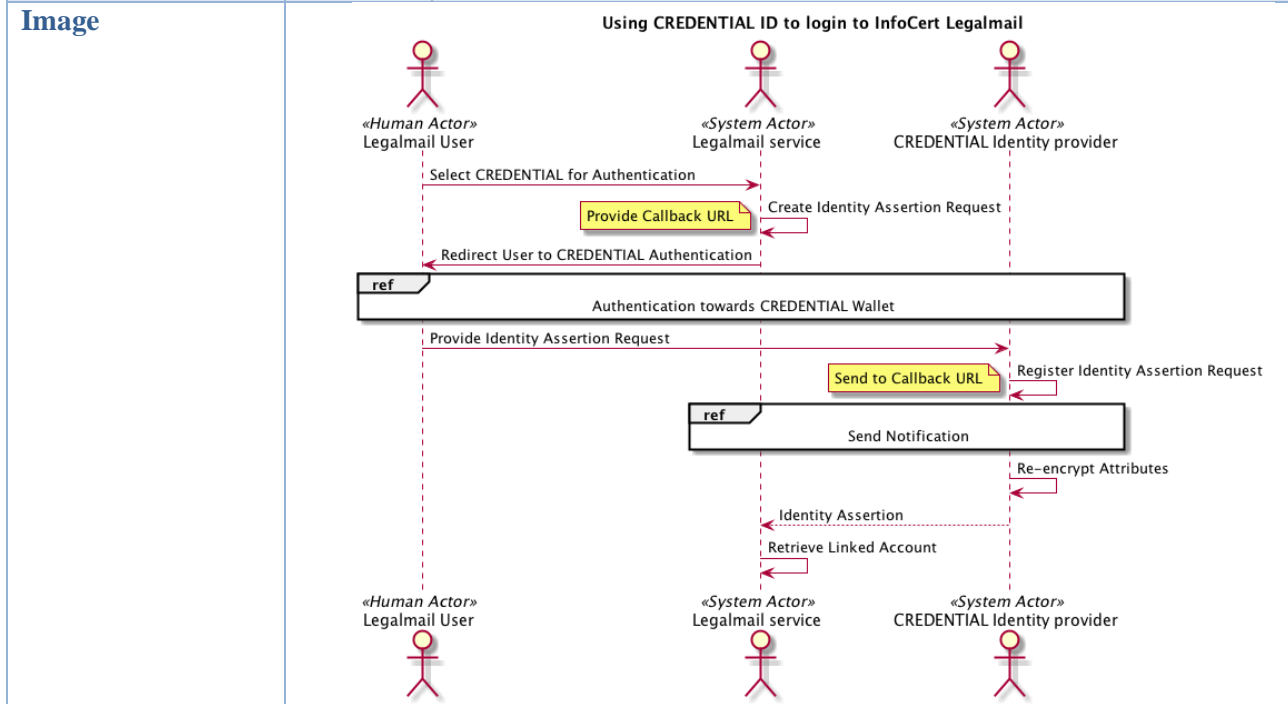

### A.3.3.2 Using CREDENTIAL ID to login to InfoCert Legalmail

<b>Use Case Name</b>	<b>Using CREDENTIAL ID to login to InfoCert Legalmail</b>
<b>ID</b>	E-BUS-1-LMAIL-B
<b>Related Use Case</b>	Generic none
<b>Main Actor</b>	- Legalmail User
<b>Secondary Actors</b>	- Legalmail Service - CREDENTIAL Identity provider
<b>Pre-conditions</b>	- Having a CREDENTIAL account
<b>Post-conditions</b>	- The CREDENTIAL participant can login to InfoCert Legalmail service
<b>Description</b>	- The Legalmail User can login to Legalmail Service by using CREDENTIAL Identity Provider

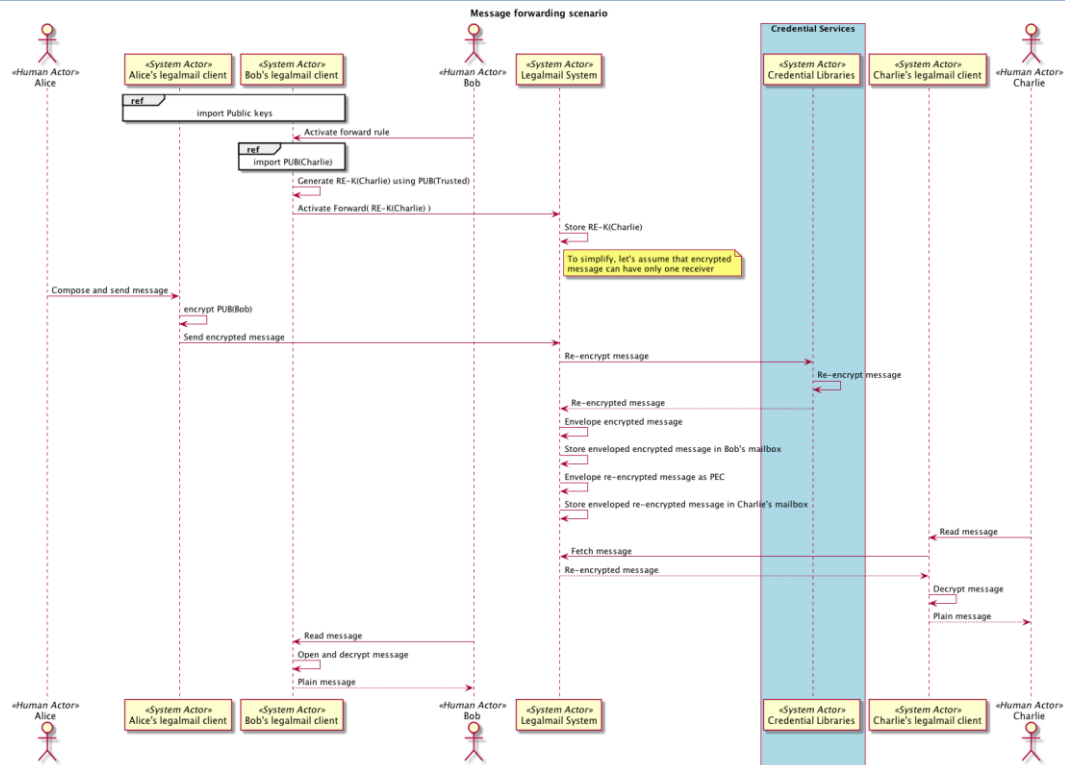

grw

### A.3.3.3 Activate encrypted Legalmail forward

<b>Use Case Name</b>	<b>Activating message forward for encrypted Legalmail</b>
<b>ID</b>	E-BUS-2-LMAIL
<b>Related Generic Use Case</b>	Link Service Provider account with CREDENTIAL account
<b>Main Actor</b>	- Legalmail User
<b>Secondary Actors</b>	- Legalmail Service - CREDENTIAL re-encryption libraries
<b>Pre-conditions</b>	- Users have an encryption service configured in their Legalmail account
<b>Post-conditions</b>	- Users are sending registered mails with legalmail client software
<b>Description</b>	- A Legalmail user that enable message encryption with other users want to temporary forward the messages he receives to one or more trusted users. The trusted users should be able to read the encrypted messages

**Image**

**A.3.3.4 Import data into Legalmail subscription form. Choose CREDENTIAL for authentication**

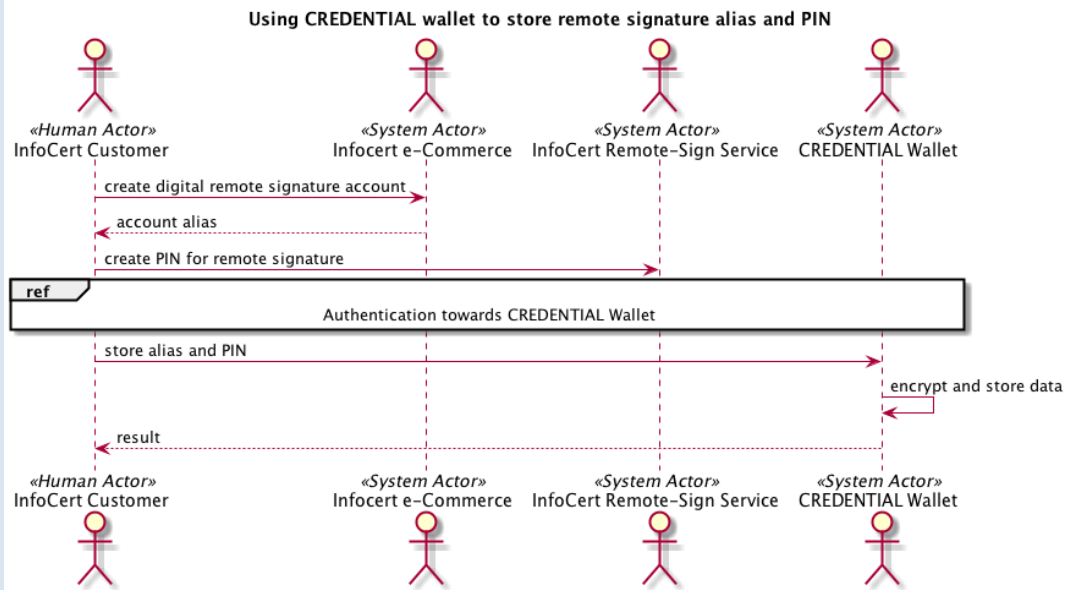

<b>Use Case Name</b>	<b>Import data from CREDENTIAL Wallet to create the contract to be signed to activate Legalmail</b>
<b>ID</b>	E-BUS-3-SHOP
<b>Related Generic Use Case</b>	none
<b>Main Actor</b>	- InfoCert Customer
<b>Secondary Actors</b>	- InfoCert e-commerce - CREDENTIAL Wallet
<b>Pre-conditions</b>	- The InfoCert Customer has a CREDENTIAL account. The InfoCert Customer has registered in CREDENTIAL Wallet the data needed to complete the Legalmail contract.
<b>Post-conditions</b>	- The Legalmail contract is created and confirmed/accepted. A new Legalmail account is created for the InfoCert_customer and linked to InfoCert_customer CREDENTIAL ID.
<b>Description</b>	- Having completed the purchase on InfoCert e-commerce, Customer has to fulfill the contract to be signed for the legalmail account creation. To proceed, customer authorizes CREDENTIAL Wallet to disclose information needed to complete the task.
<b>Image</b>	<p style="text-align: center;"><b>Import data from CREDENTIAL wallet to create the contract to be signed to activate Legalmail</b></p> <pre> sequenceDiagram     actor Customer as «Human Actor» InfoCert Customer     actor InfoCert as «System Actor» InfoCert e-Commerce     actor Wallet as «System Actor» CREDENTIAL Wallet      Customer-&gt;&gt;InfoCert: Access Service Provider     InfoCert-&gt;&gt;Wallet: Request Access Rights     Wallet--&gt;&gt;InfoCert: Grant Access Rights     InfoCert--&gt;&gt;InfoCert: Send Notification     InfoCert--&gt;&gt;InfoCert: Read Data     InfoCert-&gt;&gt;Wallet: Fill Registration Form     Wallet--&gt;&gt;Customer: Render Registration Form     Customer-&gt;&gt;InfoCert: Add additional attributes in Registration Form     Customer-&gt;&gt;InfoCert: Submit Registration Form     </pre>

### A.3.3.5 Signing a document by using a remote digital signature credential stored in a HSM

<b>Use Case Name</b>	<b>Using CREDENTIAL Wallet to store remote signature alias and PIN</b>
<b>ID</b>	E-BUS-4-SIGN-A
<b>Main Actor</b>	- InfoCert Customer
<b>Secondary Actors</b>	- Infocert e-Commerce - CREDENTIAL Wallet - InfoCert Remote Sign Service
<b>Pre-conditions</b>	- The InfoCert customer has a CREDENTIAL account. The InfoCert customer create a remote digital signature account in InfoCert remote-sign service.
<b>Post-conditions</b>	- The InfoCert Customer personal data needed for remote digital signature operations are stored in CREDENTIAL Wallet in encrypted format. The encryption keys needed to encipher alias and PIN when provided to requesting applications can be chosen by the InfoCert Customer
<b>Description</b>	- The InfoCert Customer, after creating a remote digital signature account, stores in CREDENTIAL Wallet the personal data (alias and PIN) needed to execute remote digital signature operations. The data are stored in encrypted format. The data can be provided to requesting applications only in encrypted format. The encryption keys needed to encrypt the data when provided to requesting applications can be chosen by the InfoCert Customer.

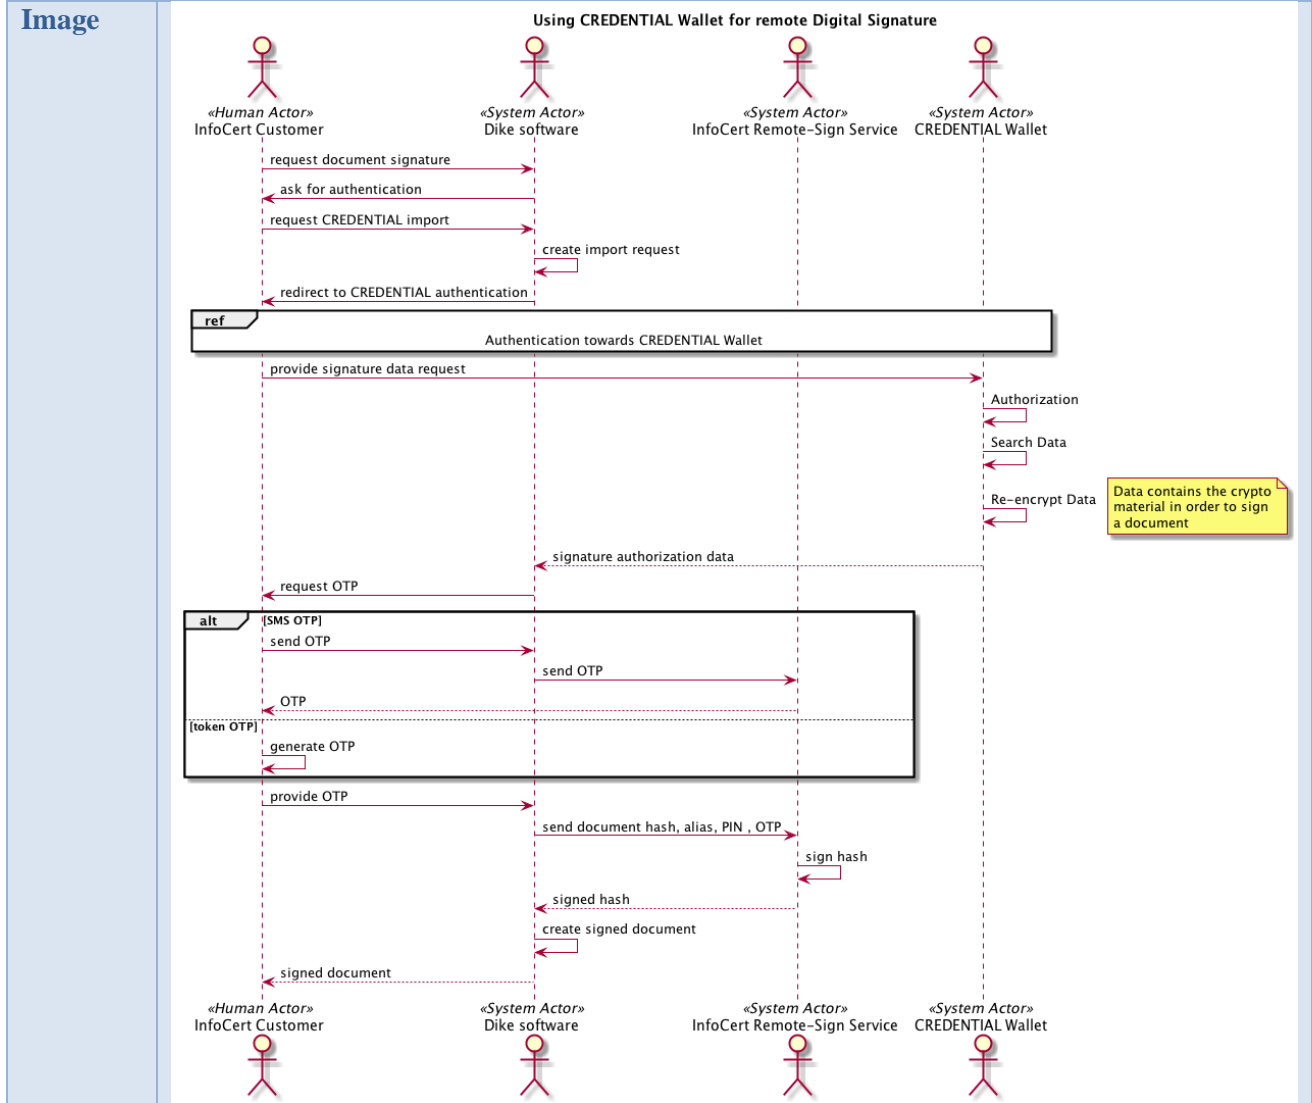

**Image**

### A.3.3.6 Using CREDENTIAL Wallet for remote digital signature

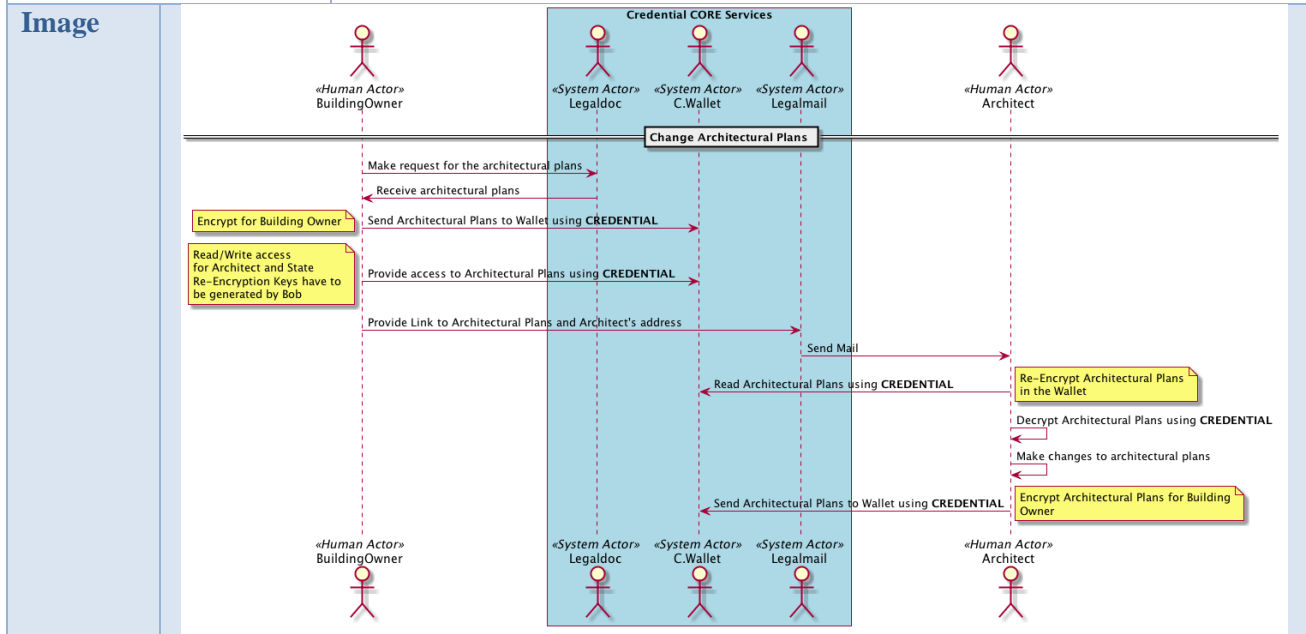

<b>Use Case Name</b>	<b>Using CREDENTIAL Wallet for remote digital signature</b>
<b>ID</b>	E-BUS-4-SIGN-B
<b>Main Actor</b>	- InfoCert Customer
<b>Secondary Actors</b>	- CREDENTIAL Wallet - InfoCert Remote-Sign Service - Dike software
<b>Pre-conditions</b>	- The InfoCert Customer has a CREDENTIAL account. The InfoCert Customer has a remote digital signature account in InfoCert Remote-sign service. The InfoCert Customer personal data needed for remote digital signature operations are stored in CREDENTIAL Wallet in encrypted format.
<b>Post-conditions</b>	- The InfoCert Customer completes the needed remote digital signature operations.
<b>Description</b>	- The InfoCert Customer can use personal data stored in CREDENTIAL Wallet when executing remote digital signature operations.

### A.3.3.7 Editing Architectural Plans

<b>Use Case Name</b>	<b>Change Architectural Plan</b>
<b>ID</b>	E-BUS-5-AP-A
<b>Main Actor</b>	- Building Owner
<b>Secondary Actors</b>	- CREDENTIAL Wallet - Legaldoc - LegalMail - Architect
<b>Pre-conditions</b>	- Bob (Building Owner) and Archi (Architect) have CREDENTIAL account. - Bob and Archi have LegalMail account. - Bob has Legaldoc account.
<b>Post-conditions</b>	The architectural plans are ready for the verification procedure.
<b>Description</b>	<ul style="list-style-type: none"> <li>- Building owner (Bob) makes changes on architectural plans.</li> <li>- Bob retrieves the architectural plans from Legaldoc using CREDENTIAL Wallet as Identity provider. After getting the plans from Legaldoc, he encrypts and uploads into the CREDENTIAL Wallet. Subsequently Bob creates proxy-re-encryption keys for Archi (Architect). Then Bob sends an email to Archi (Architect), using Legalmail as mail service. So from now on, Bob could be offline until he receives the confirmation email of the procedure termination.</li> <li>- Archi receives email from the Bob to apply the changes on architectural plans. Archi downloads the plans using the proxy-re-encryption key. Archi decrypts the architectural plans using CREDENTIAL and makes the changes on plans. In the end, he saves the re-encrypted plans and uploads them into CREDENTIAL Wallet.</li> </ul>

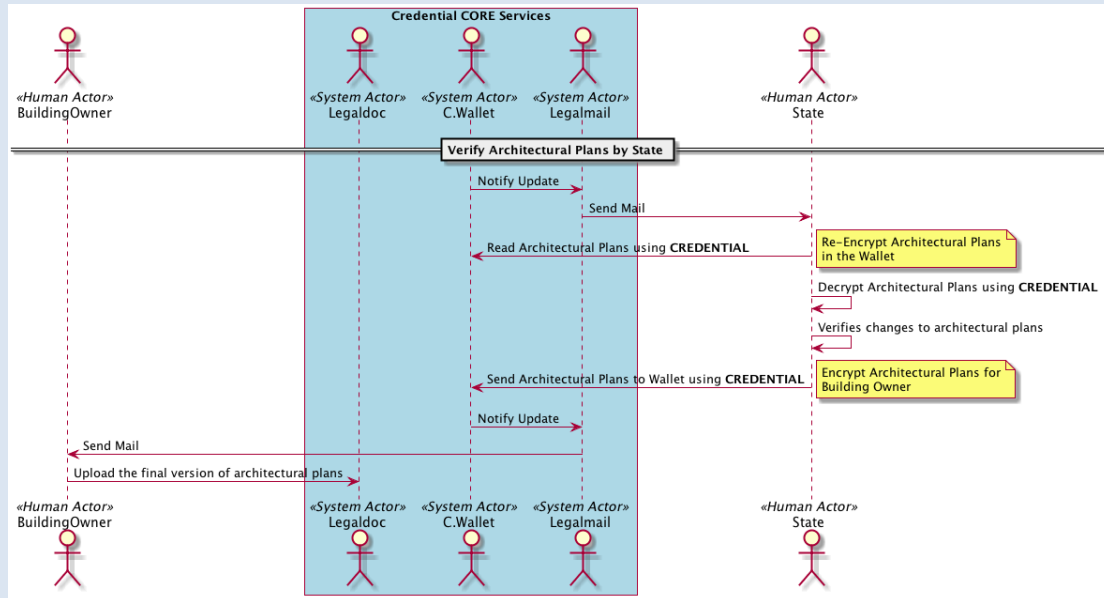

### A.3.3.8 Verify Architectural Plans

<b>Use Case Name</b>	<b>Verify Architectural Plans</b>
<b>ID</b>	E-BUS-5-AP-B
<b>Main Actor</b>	- State Engineer
<b>Secondary Actors</b>	- Credential Wallet - Legaldoc - LegalMail - Building Owner
<b>Pre-conditions</b>	- Bob (Building Owner) and Sam (State Engineer) have CREDENTIAL account. - Bob and Archi have LegalMail account. - Bob has Legaldoc account. - Sam has received email for the verification procedure.
<b>Post-conditions</b>	The architectural plans are stored in Legal doc.
<b>Description</b>	<ul style="list-style-type: none"> <li>- After the changes on architectural plans, CREDENTIAL Wallet sends a notification to Sam (State engineer) to inform him about the architecture plans. Sam receives the plans from CREDENTIAL Wallet using the proxy-re-encryption key and acts as follow. Decrypts the plans with CREDENTIAL technology and verifies the changes on the architectural plans. Encrypts and finally uploads the architectural plans into Credential Wallet.</li> <li>- Finally, CREDENTIAL Wallet receives the architectural plans and notifies the offline Building Owner to check the architectural plans.</li> <li>- Bob stores the architectural plans in Legaldoc.</li> </ul>

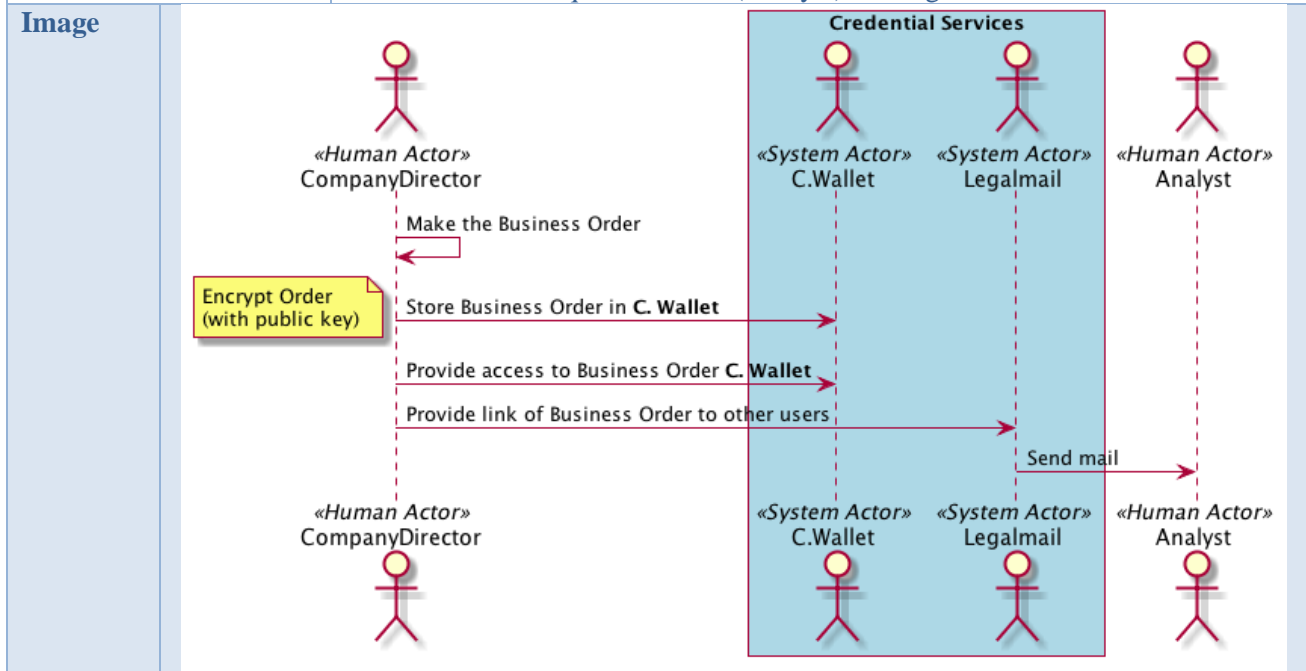

**Image**

### A.3.3.9 Business Report Ordering by Company

<b>Use Case Name</b>	<b>Business Report Request</b>
<b>ID</b>	E-BUS-6-BR-A
<b>Main Actor</b>	- Company Director
<b>Secondary Actors</b>	- CREDENTIAL Wallet - LegalMail - Analyst
<b>Pre-conditions</b>	- Codie (Company Director) and Anna (Analyst) have CREDENTIAL account. - Codie and Anna have LegalMail account. - Codie User has stored his signature alias, public key in C. Wallet.
<b>Post-conditions</b>	Business report is ready for the verification procedure.
<b>Description</b>	- Codie (Company director) decides to make an order for his Company. - Codie makes the order for his company. he uses C. Wallet (with his public key) to encrypt the order. He stores the order in C. Wallet and sends a notification request to Anna (Analyst) via Legalmail.

### A.3.3.10 Business Report Response

<b>Use Case Name</b>	<b>Business Report Response</b>
<b>ID</b>	E-BUS-6-BR-B
<b>Main Actor</b>	- Analyst
<b>Secondary Actors</b>	- CREDENTIAL Wallet - Legaldoc - LegalMail - Company Director
<b>Pre-conditions</b>	- Codie (Company Director) and Anna (Analyst) have CREDENTIAL account. - Codie and Anna have LegalMail account. - Codie User has stored his signature alias, public key in C. Wallet. - Anna has received email for the verification procedure.
<b>Post-conditions</b>	Business report is verified and stored in Legaldoc.
<b>Description</b>	- Anna decrypts the business order and checks/verifies it. After the verification step he creates the business report. Encrypts and stores business report into C. Wallet. Then he sends a notification back to Codie. Codie decrypts with C. Wallet, reads and it. - The process stops when he stores the business report in Legaldoc.

**Image**
